Introduction and Algorithmic Fairness (Part 1)

Responsible Data Science
DS-UA 202 and DS-GA 1017

Weeks 1–2

Instructors: Julia Stoyanovich and George Wood

This reader contains links to online materials and excerpts from selected articles on introduction to responsible data science and on algorithmic fairness. For convenience, the readings are organized by course week. Please note that some excerpts end in the middle of a section. Where that is the case, the partial section is not required reading.

Week 1: Introduction

DATA, RESPONSIBLY
#1
MachineLearnist COMICS
MIRROR, MIRROR

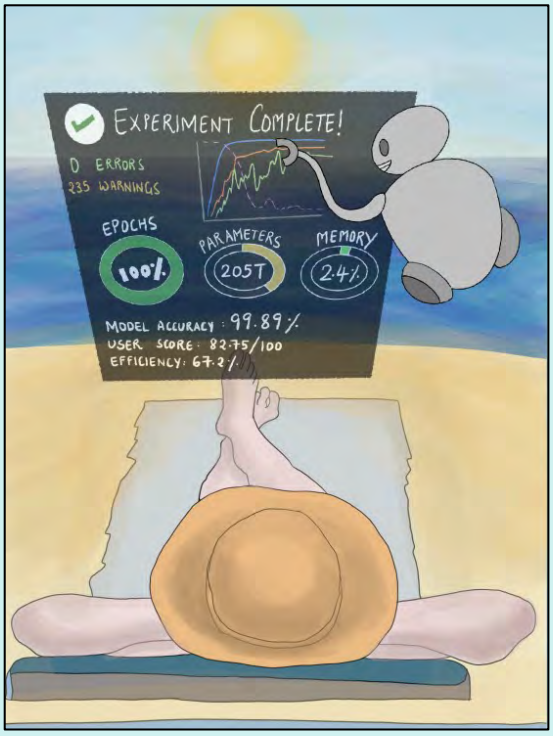
HEY THERE!
YOU MADE IT!

WELCOME TO **OPTOPIA!** (1)

IT'S THE LAND OF ALGORITHM DRIVEN UTOPIA!

REMEMBER ALL THOSE CRAZY SCIENTISTS TALKING FOR DECADES ABOUT CREATING ARTIFICIAL INTELLIGENCE? WELL, THIS IS IT.



WE ALL LAUGHED AT THEM AND SAID IT WAS IMPOSSIBLE (2), BUT YOU KNOW WHAT...

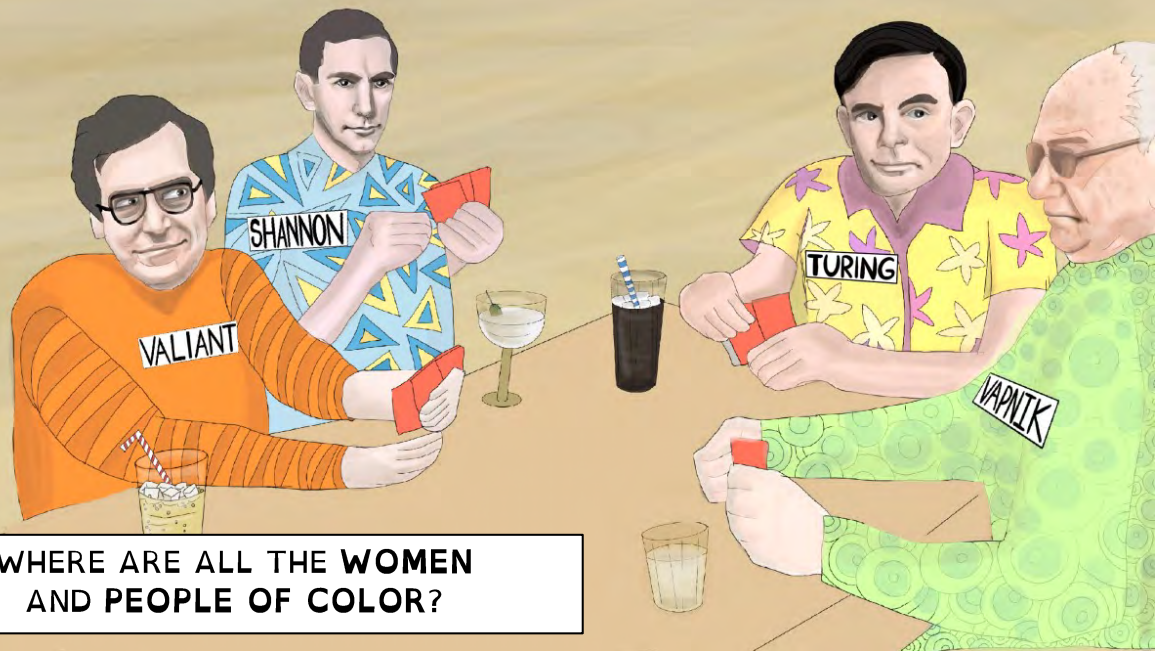
THEY WERE RIGHT. THEY DID IT.

AND NOW THEY JUST SIT BACK AND RELAX WHILE THEIR REPLICAS DO ALL THE WORK.

LOOK AT THIS GUY, HE JUST PUBLISHED A NEW PAPER, ALL WHILE SIPPING A NICE GLASS OF WINE.

I KNOW WHAT YOU'RE THINKING..

IS THIS YET ANOTHER WHITEWASHED HOLLYWOOD PRODUCTION?



WHERE ARE ALL THE **WOMEN** AND **PEOPLE OF COLOR**?

IF TECHNOLOGICAL SUPREMACY LIES AT THE SUMMIT OF THE AI MOUNTAIN THAT HUMANITY MUST SCALE AT ALL COSTS,

THEN OUR PREPARATION FOR THE CLIMB AND THE EQUIPMENT AVAILABLE TO US...

...WILL MAKE ALL THE DIFFERENCE.

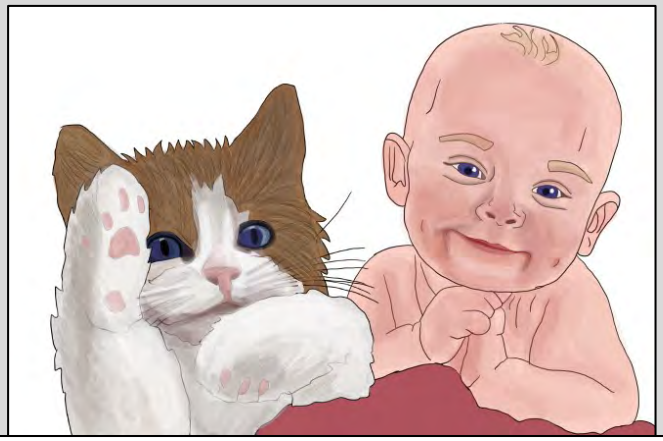
BASED ON OUR CURRENT TRAJECTORY

NOT EVERYONE WILL MAKE IT.

PART I: ROCKFALL

(WHAT WORK DO WE FUND?)

AI IS THE SHINIEST TOY ON THE BLOCK AND SO, INEVITABLY, ALL THE **MONEY-MAGPIES** HAVE COME FLOCKING.

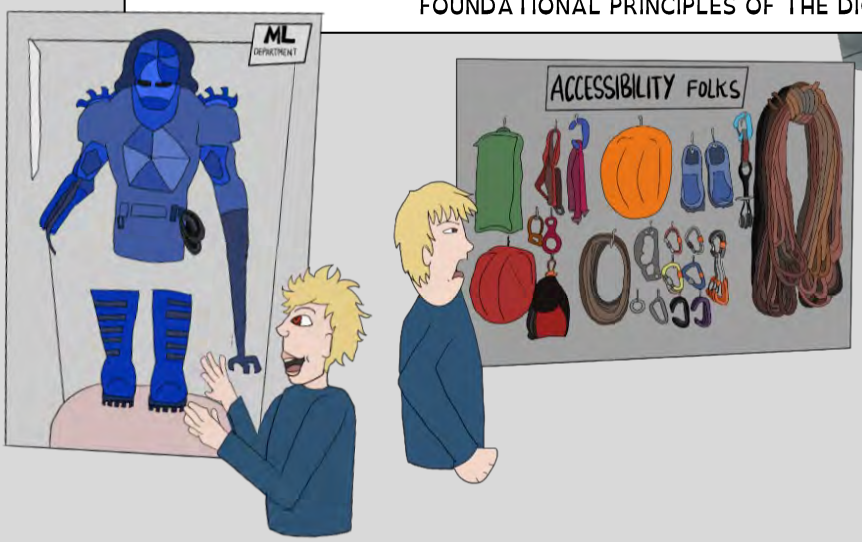


BUDGET CUTS

WHAAA

HOWEVER, BEYOND THE USUAL SLEW OF POPULAR APPLICATIONS, SUCH AS **VISION** AND **LANGUAGE MODELING**, THE MONEY SELDOM TRICKLES DOWN.

FOR EXAMPLE, TAKE ***HUMAN-COMPUTER INTERACTION (HCI)***. THIS WORK FOCUSES ON FOUNDATIONAL PRINCIPLES OF THE DIGITAL AGE, SUCH AS **EQUITABLE ACCESS**,



AND YET IT SELDOM SEES THE KIND OF ECONOMIC BACKING OR MEDIA COVERAGE AS MACHINE LEARNING (ML) DOES.

LET'S GIVE ***HCI*** A MOMENT IN THE **SPOTLIGHT**, SHALL WE?

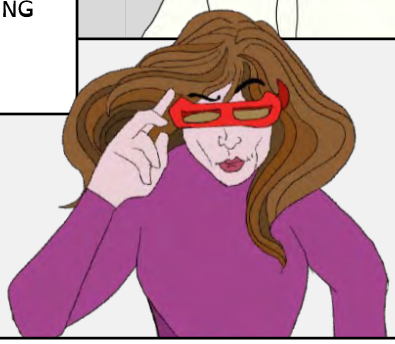
DIGITAL ACCESSIBILITY

DID YOU KNOW?
15% OF THE ENTIRE POPULATION EXPERIENCE SOME FORM OF DISABILITY- VISUAL, AUDITORY, MOTOR OR COGNITIVE. (3)

"THE POWER OF THE WEB IS IN ITS UNIVERSALITY. ACCESS BY EVERYONE REGARDLESS OF DISABILITY IS AN ESSENTIAL ASPECT"
-TIM BERNERS-LEE

SO, WHAT IS **DIGITAL ACCESSIBILITY**?
THIS VOLUME IS ABOUT ML AND DATA, SO YOU'RE PROBABLY IMAGINING ROBOTIC ARMS TRAINED ON HUNDREDS OF THOUSANDS OF RUNS OF SIMULATED MOVEMENT AND CUSTOMIZED TO THE WEARER'S MEASUREMENTS AND MOTION OF ACTION.

OR HOW ABOUT A FULLY AUTOMATED, HYPER SENSITIVE ROBOTIC ARMOUR THAT SELF-LEARNS AND AUTO-NAVIGATES FOR THE PHYSICALLY DISABLED?



OR GROUND-BREAKING, HYPER-INTELLIGENT GOGGLES FOR THE BLIND, THAT COLLECT THE DISTORTED IMAGE FROM THE WEARER'S RETINAS AND RECONSTRUCT IT TO A SHARP, 10800000 PIXEL IMAGE FOR SUPERHUMAN VISION?

MAYBE, IF ELON MUSK DECIDED TO GET INTO THE ACCESSIBILITY GAME...

IN OUR REALITY, DIGITAL ACCESSIBILITY IS FOCUSED ON MAKING SURE WEB PLATFORMS ARE EASILY NAVIGABLE AND USABLE BY PEOPLE WITH ANY KIND OF DISABILITY

IT IS THIS VERY WORK THAT MAKES SURE THAT THE IMAGE YOU JUST POSTED ON INSTAGRAM HAS CAPTIONS

SO THAT THE BLIND USERS OF THE PLATFORM CAN ALSO PARTAKE IN YOUR TRIUMPH OVER THAT SOURDOUGH RECIPE.

OR WHEN YOU DROP A NEW TUTORIAL VIDEO FOR ALL ONE SQUILLION OF YOUR SUBSCRIBERS TO ENJOY,

IT IS THIS WORK THAT CONVERTS YOUR VOCAL PEARLS OF WISDOM INTO TEXT FOR YOUR DEAF FOLLOWERS.

ACCESSIBILITY NEEDS TO BE A FUNDAMENTAL DESIGN PRINCIPLE FOR BUILDING WEBSITES AND SOFTWARE,

BUT IN OUR QUEST FOR OPTOPIA, IT IS USUALLY OVERLOOKED.

WITHOUT **A11IES** (4), THE DEMOGRAPHIC THAT WAS HOLDING ON TO THE ACCESSIBILITY ROPE IS NOW CUT OFF.

LET'S GET RID OF THE **MAGPIE MENTALITY**?

FOR YOUR NEXT FUN DATA SCIENCE PROJECT, INSTEAD OF SOME COMMUNITY-OVERFITTED IMAGE RECOGNITION CHALLENGE, MAYBE CHOOSE AN **OPEN PROBLEM IN DIGITAL ACCESSIBILITY**, SUCH AS AUTOMATIC VIDEO CAPTIONING.
THEN HOPEFULLY ONE DAY THERE WILL BE **"NO MORE CRAPTIONS"** (5)

PART 2: GHOSTS IN THE SHELL

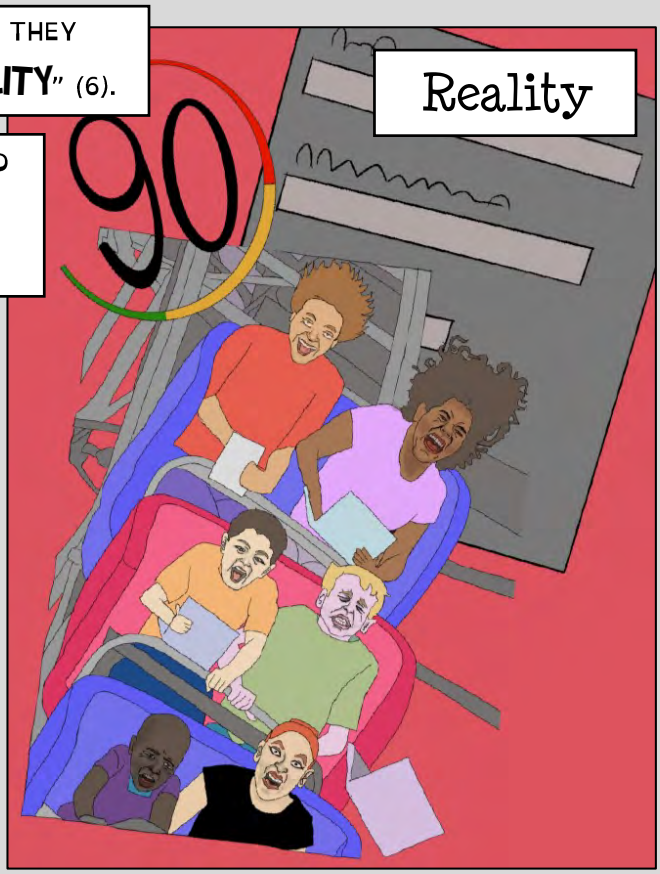
(WHO ARE WE BUILDING MODELS FOR?)

WE HAVEN'T YET FIGURED OUT HOW TO MAKE EXISTING DIGITAL PLATFORMS ACCESSIBLE TO EVERYONE, YET WE'RE ALREADY JUMPING TO FORGE A NEW "INTELLIGENT" CLASS OF WEB APPLICATIONS.

WE'RE SO CAUGHT UP IN THE **"HOW"** (USING ML/AI/DL/DS !!!) THAT WE FORGET TO ASK, **"FOR WHOM''?**

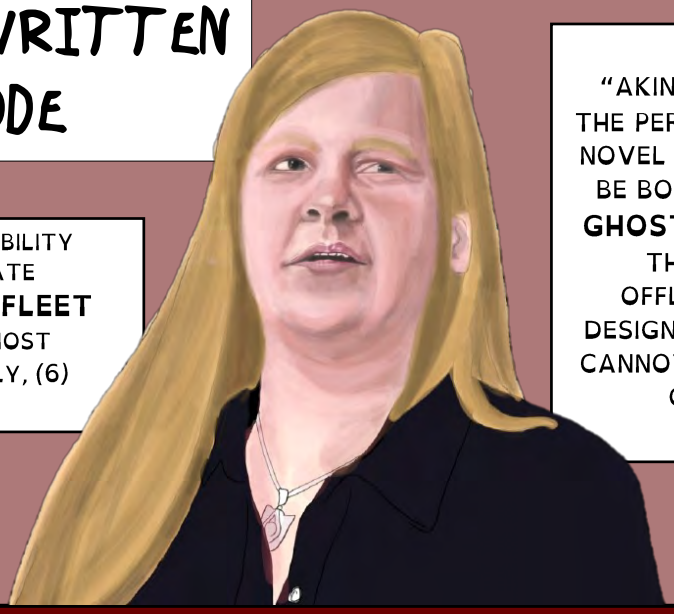
WHEN PLATFORMS ARE NOT DESIGNED FOR EVERYONE, THEY GIVE OFF THE STENCH OF "**ENCODED INHOSPITALITY**" (6).

SEEMINGLY INNOCUOUS THINGS SUCH AS **POP-UPS** AND **EXPIRING FORMS** ON WEBSITES COMPLETELY HIJACK THE ONLINE EXPERIENCE OF USERS WITH DISABILITIES WHO RELY ON SCREEN READERS.



GHOSTWRITTEN CODE

AS ACCESSIBILITY ADVOCATE **CHANCEY FLEET** PUTS IT MOST ELOQUENTLY, (6)



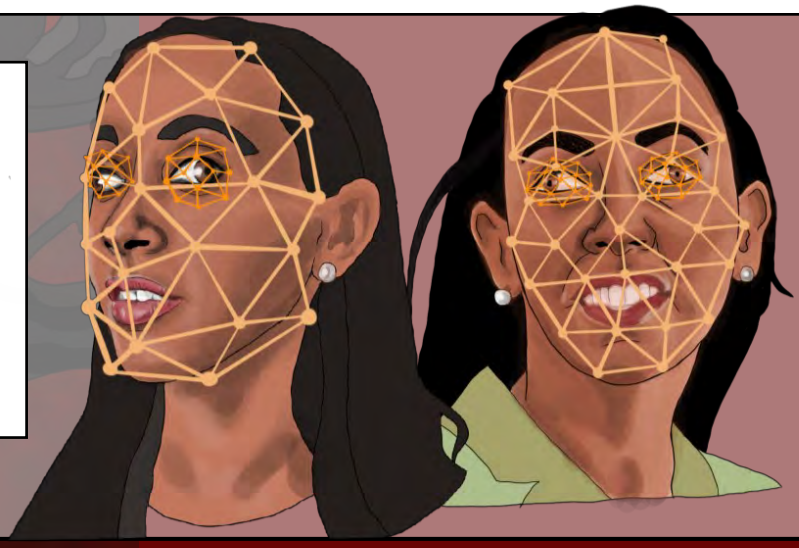
"AKIN TO HOW A **GHOSTWRITER** IS THE PERSON WHO IS PAID TO COMPOSE A NOVEL THAT SOMEONE ELSE COULD NOT BE BOTHERED TO WRITE THEMSELVES, **GHOSTWRITTEN CODE** IS SOFTWARE THAT THE ORGANIZATION HAS OFFLOADED ON PROGRAMMERS TO DESIGN FOR USERS THAT THE COMPANY CANNOT BE BOTHERED TO ENGAGE WITH OR EMPLOY THEMSELVES. "

THESE GHOSTS ARE MAKING THEIR WAY INTO DATA-DRIVEN PRODUCTS AS WELL.

TAKE THE INFAMOUS FACIAL RECOGNITION SOFTWARE THAT HAS BEEN ALL OVER THE NEWS RECENTLY. RACIAL INJUSTICES ARE PROBLEMATIC ENOUGH, BUT HAVE YOU CONSIDERED HOW THESE MODELS DISCRIMINATE AGAINST BLACK DISABLED PEOPLE?

AS DISABILITY RIGHTS ADVOCATE **HABEN GIRMA** EXPLAINS (7),

"MY EYES MOVE INVOLUNTARILY, EACH ONE SWINGING TO ITS OWN MUSIC. THEY'VE DANCED THIS WAY FOR AS LONG AS I CAN REMEMBER."



HOW WELL DO YOU THINK **FACIAL RECOGNITION** WOULD PERFORM ON **BLIND BLACK PEOPLE**?

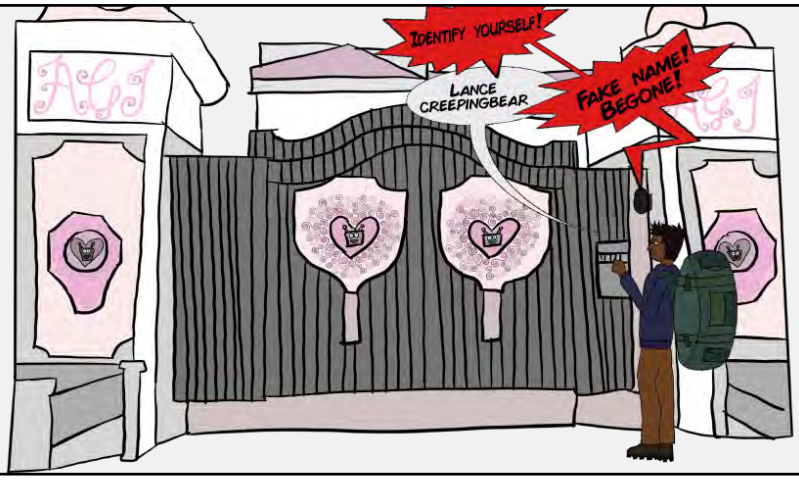
HAVING BEEN TRAINED ON THE FACIAL DYNAMICS OF SIGHTED WHITE PEOPLE, FACIAL RECOGNITION TECHNOLOGY PEDDLES AN ABLEIST AND RACIST NARRATIVE.

THE ATYPICAL, ASYMMETRIC MECHANISMS OF THE EYES OF SOME BLIND PEOPLE ARE PERCEIVED AS ABNORMAL, ANOMALOUS AND THREATENING BY THESE SYSTEMS.

HOW IS IT THAT WE CAN **FORGET** TO CONSIDER **ENTIRE DEMOGRAPHICS** WHILE DESIGNING PRODUCTS?

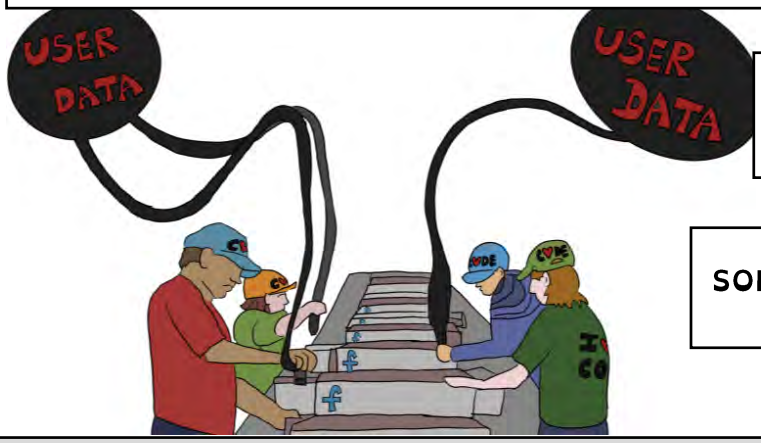
TAKE FACEBOOK'S **"REAL NAME" POLICY** THAT INDISCRIMINATELY TARGETED NATIVE AMERICANS (8)

THE LARGEST SOCIAL NETWORK IN THE WORLD SURE OVERLOOKED THE **CULTURAL AND LINGUISTIC DIFFERENCES** IN NAMES ACROSS THE GLOBE



AND ENDED UP DEPLOYING A BIGOTED ALGORITHM THAT BLOCKED USERS WHOSE NAMES DID NOT CONFORM WITH THE WESTERN ARCHETYPE OF NAMES

IN ADDITION TO COMPLETELY OVERLOOKING **WHO** WE ARE BUILDING A PRODUCT FOR, HAVE WE ALTOGETHER DONE AWAY WITH THE QUESTION OF WHETHER A CERTAIN PRODUCT ***SHOULD*** EVEN BE BUILT?



SURE, YOU HAVE SEVERAL HUNDRED TERABYTES OF USER DATA AND A FLEET OF ENGINEERS WAITING TO DIP THEIR HANDS INTO THE ML PIE,

BUT, IS YOUR PRODUCT A **SOLUTION** TO AN ACTUAL PROBLEM OR SIMPLY **SOLUTIONISM**

PART 3: THE POISONING

(WHAT PROBLEMS ARE WE TRYING TO SOLVE?)

TECHNOLOGY IS SUPPOSED TO DRIVE INNOVATION AND MOVE US TOWARDS A MORE SOPHISTICATED AND ADVANCED FUTURE, RIGHT?

AND SO WHEN THE NEW FLAVOR OF TECHNOLOGICAL ADVANCEMENT COMES TO MARKET, WHAT ELSE MUST WE DO BUT EAGERLY LAP IT UP?

WELL, IF THERE'S ANY MENTION OF "INTELLIGENCE" ON THE PRODUCT BEING HANDED TO YOU...

YOU MIGHT NOT WANT TO DRINK THAT!

IT'S SNAKE OIL!

-**ARVIND NARAYANAN**
PROFESSOR OF COMPUTER SCIENCE AT PRINCETON UNIVERSITY (9)

WHAT IS AI-SNAKE OIL?

SNAKE OIL IS THE MYSTICAL SUBSTANCE THAT IS CREATED BY TAKING EQUAL PARTS MEDIA HYPE AND PUBLIC MISINFORMATION AND STIRRING THEM INTO A POTION, WITH AN IRRESISTIBLE LABEL THAT SCREAMS "DATA" AND "INTELLIGENCE"

... AND AFTER YEARS OF EXPERIMENTATION, THE TECH INDUSTRY HAS FINALLY PERFECTED THE RECIPE!

DEVELOPMENTS SUCH AS **ALPHA-GO** (THE GO PLAYING AI) AND **SHAZAM** (THE MUSIC RECOGNITION APP) ARE INDICATIVE OF GENUINE SCIENTIFIC PROGRESS AND DO DEMONSTRABLY MORE GOOD THAN HARM.

WHY? BECAUSE THE RULES OF GO DON'T CHANGE WHETHER THE PLAYER IS **MALE/FEMALE, BLACK/WHITE, RICH/POOR!**

PERCEPTION TASKS, SUCH AS **FACIAL RECOGNITION**, THAT ARE INTERTWINED WITH THE **SOCIAL, POLITICAL AND CULTURAL UNDERPINNINGS** OF THE DATA ON WHICH THEY WERE TRAINED, ARE FAR MORE TOXIC.

THINGS START TO GET REALLY TOXIC IN SETTINGS SUCH AS **HIRING, MODERATION OF HATE SPEECH OR ALLOCATION OF GRADES** (10), WHEN WE TRY TO IMPOSE OBJECTIVITY (FIT A MATHEMATICAL FUNCTION ONTO THE DATA) ON **HUMAN JUDGMENT**, WHICH IS INHERENTLY SUBJECTIVE

WE GET REALLY CREATIVE WITH WHAT WE THINK WE CAN ACHIEVE WITH TECHNOLOGY WHEN WE START **PREDICTING SOCIAL OUTCOMES** USING ALGORITHMS, SUCH AS **COMPAS FOR CRIMINAL SENTENCING**. (11)

WE LOOK AROUND AND SEE THE HARDEST PROBLEMS KNOWN TO US AND DECIDE THAT, SINCE WE CANNOT SOLVE THEM, WE MUST INSTEAD GET A MACHINE TO DO IT FOR US.

BUT DO YOU KNOW WHY THESE ARE THE HARDEST PROBLEMS TO SOLVE?

BECAUSE THESE ARE SYSTEMIC ISSUES THAT HAVE BEEN SLOWLY STEWING FOR CENTURES OVER

WITH A DASH OF HISTORICAL CONTEXT, A SPRINKLE OF CULTURE AND A GENEROUS HEAPING OF RACE, GENDER AND CLASS POLITICS

ALL COMPOUNDING INTO A COMPLEX BROTH OF ENTROPY;

EXPECTING A MACHINE TO TAKE ONE WHIFF OF THIS STEW AND BE ABLE TO PREDICT THE FUTURE IS JUST FUNDAMENTALLY DUBIOUS.

UNDERNEATH ALL THE BELLS AND WHISTLES OF THIS LARGER THAN LIFE SPECTACLE IS A DANGEROUSLY HIGH-RISK GAME THAT WE DON'T EVEN KNOW WE'RE A PART OF!

WELCOME TO THE

AI CIRCUS!

THE **BALANCING ACT** BETWEEN MAKING A MODEL SIMULTANEOUSLY **ACCURATE, FAIR AND FEASIBLE** IS REALLY A SPECTACLE FOR ALL TO SEE!

TAKE AI FOR HIRING.
IF A COMPANY INDULGES IN DISCRIMINATORY HIRING PRACTICES FOR YEARS ON END,

PREDICTIVE MODELS THAT AUTOMATE SUCH DECISIONS WILL FAVOUR THE SAME PEDIGREE OF APPLICANTS THAT WERE HISTORICALLY HIRED

AN EXTREMELY "**ACCURATE**" ALGORITHM WILL FAITHFULLY REPLICATE THE DISCRIMINATORY BEHAVIOR OF ITS **HUMAN TRAINERS.**

COUNTERACTING DATA BIAS BY ENFORCING A NOTION OF **"FAIRNESS"** IN PREDICTION COMES AT THE COST OF MODEL **"ACCURACY"** – WHEN ACCURACY IS MEASURED ON THE BIASED TRAINING DATA

WHY? BECAUSE AN ALGRORITHM THAT HAS ACCURATELY LEARNED FROM BIASED DATA WILL ALSO BE BIASED, BY CONSTRUCTION

THIS PROBLEM GETS HARDER BECAUSE ML MODELS ARE **OPAQUE**. WE HAVE LIMITED UNDERSTANDING ABOUT **HOW** A PREDICTION WAS MADE.

SOMETIMES THE DATA IS SO TERRIBLY BIASED THAT IN ORDER TO DELIVER FAIRER OUTCOMES, WE NEED TO GO BACK AND COLLECT A WHOLE NEW SAMPLE OF DATA.

THIS MIGHT NOT BE FEASIBLE IN ALL CIRCUMSTANCES AND SO COMPANIES HAVE TO TAKE A STAND ON WHICH METRIC THEY VALUE MOST.
FEASIBILITY OR FAIRNESS?

DO THEY PUSH FOR A FAIR BUT EXPENSIVE ALGORITHM OR SETTLE FOR THE "MOST FAIR" ALGORITHM THAT THEY CAN AFFORD AT THE LEAST COST?

THEN THERE'S THE **PYRAMID OF ML SCHOLARSHIP.**

AT THE VERY TOP OF THE PYRAMID SITS (PRECARIOUSLY) OUR M.O. OF **SOTA CHASING**.

SOTA OR **STATE OF THE ART** REFERS TO THE LATEST REPORTED METRIC ON A CERTAIN TASK

SOTA-CHASING IS ABOUT OUTPERFORMING THE COMPETITION ON THAT BENCHMARK, EVEN **MARGINALLY**

SOTA-CHASING

DATA + COMPUTE

STATISTICAL LEARNING THEORY

WE CREATE A BENCHMARK DATASET AND THEN DECLARE A METRIC, USUALLY ACCURACY, BY WHICH WE WILL MEASURE SUCCESS.

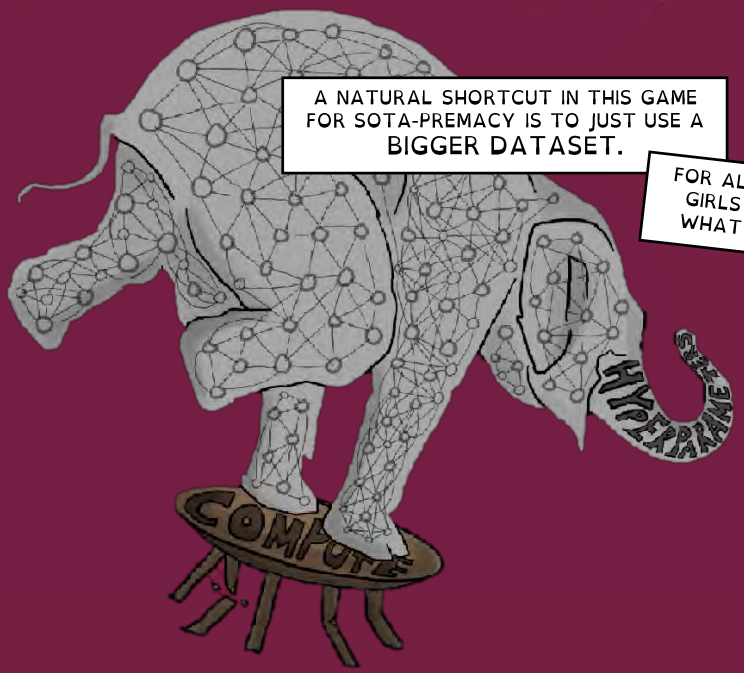
NOW PROJECT AFTER PROJECT AND PAPER AFTER PAPER SETS OUT TO ATTAIN THAT 0.01 INCREASE IN ACCURACY IN ORDER TO BE DEEMED "PUBLISHABLE"

ALL THE WHILE TAKING IT FOR GRANTED THAT ACCURACY IS EVEN THE RIGHT METRIC TO MEASURE PROGRESS AGAINST.

WHY IS THIS A PROBLEM?

BECAUSE SOTA-CHASING ASSUMES THAT THE BENCHMARK IS WORTH CHASING! THAT THE DATASET IS REPRESENTATIVE OF THE POPULATION. AND THAT MARGINAL ACCURACY IMPROVEMENT MAKES A DIFFERENCE

A NATURAL SHORTCUT IN THIS GAME FOR SOTA-PREMACY IS TO JUST USE A BIGGER DATASET.



FOR ALL YOU GPT3 (12) FAN BOYS AND GIRLS OUT THERE, THIS IS EXACTLY WHAT YOU'VE BEEN RAVING ABOUT:

THE SHEER, UNFETTERED ACCESS TO A GARGANTUAN DATASET AND COMPUTE (OR MOOLAH TO PAY FOR COMPUTE)

TO CREATE MODELS THAT BEAT THE STATE OF THE ART

AND GIVE THE ILLUSION OF SCIENTIFIC PROGRESS

SURE, THERE ARE THOSE FOLKS IN THE COMMUNITY WHO ARE THINKING DEEPLY ABOUT PROBLEM FORMULATION, REAL WORLD IMPACT AND SCIENTIFIC RIGOR. UNFORTUNATELY, DEEP, THOUGHTFUL WORK OF THIS KIND IS JUST NOT GLAMOROUS

...AND SO, WHEN THE CURTAIN FALLS, IT ISN'T THESE RESEARCHERS YOU ARE APPLAUDING.

HOW COME THESE FOLKS NEVER TAKE CENTER STAGE?
WELL, IT'S PARTLY BECAUSE, LIKE IN EVERY OTHER DOMAIN, THE RICH JUST KEEP GETTING RICHER.

THE SET OF RESEARCHERS WHO DEBUNK SOCIETAL HARMS OF TECHNOLOGY ARE LIKELY TO BE FROM THE SAME DEMOGRAPHIC THAT WILL BE MOST DEEPLY AFFECTED BY THOSE VERY HARMS.

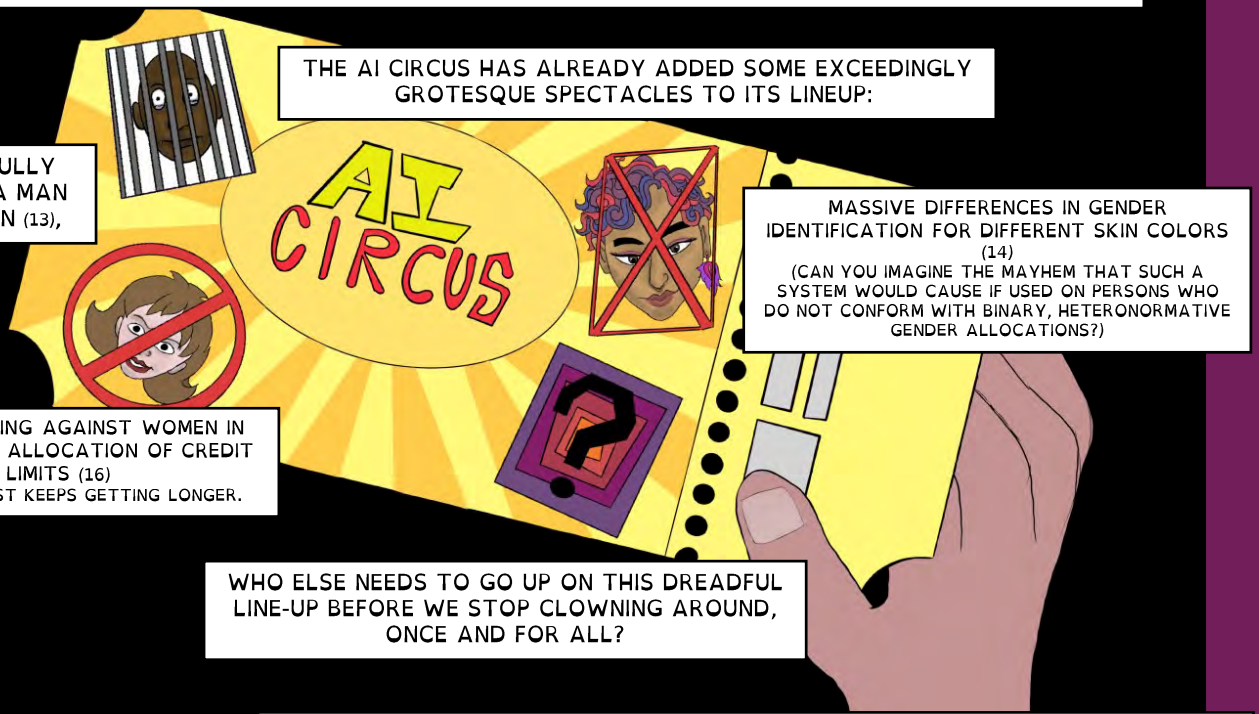
AND THIS IS NEVER THE MAJORITY.

IF OUR SCHOLARSHIP IS A REFLECTION OF OUR IDEAS, THEN WE CANNOT AFFORD TO CENSOR OR COMPLETELY ERASE THE VOICES OF ENTIRE DEMOGRAPHICS.

IF OUR PRODUCTS ARE A REFLECTION OF THE PROBLEMS THAT WE ARE TRYING TO SOLVE, THEN WE CANNOT BUILD SOLUTIONS THAT HELP ONE STRATUM AND CAUSE EXTENSIVE DAMAGE TO ANOTHER.

THE AI CIRCUS HAS ALREADY ADDED SOME EXCEEDINGLY GROTESQUE SPECTACLES TO ITS LINEUP:

WRONGFULLY SENDING A MAN TO PRISON (13),



MASSIVE DIFFERENCES IN GENDER IDENTIFICATION FOR DIFFERENT SKIN COLORS (14)
(CAN YOU IMAGINE THE MAYHEM THAT SUCH A SYSTEM WOULD CAUSE IF USED ON PERSONS WHO DO NOT CONFORM WITH BINARY, HETERONORMATIVE GENDER ALLOCATIONS?)

DISCRIMINATING AGAINST WOMEN IN HIRING (15), IN ALLOCATION OF CREDIT LIMITS (16)
...THE LIST JUST KEEPS GETTING LONGER.

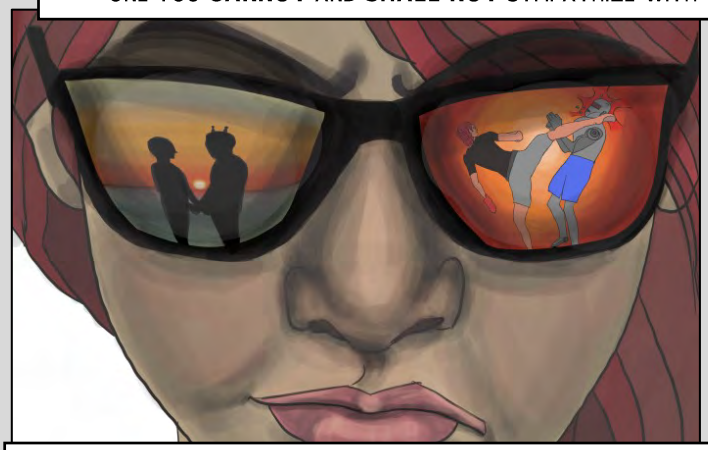
WHO ELSE NEEDS TO GO UP ON THIS DREADFUL LINE-UP BEFORE WE STOP CLOWNING AROUND, ONCE AND FOR ALL?

BEFORE YOU REACH FOR YOUR SMARTPHONE TO GET ON TWITTER TO RAGE AGAINST THE AI MACHINE OR JOIN THE RANKS OF THE TECHNO BASHERS, STOP AND LOOK AROUND

ALL AROUND ME ARE FAMILIAR FACES
WAY OF THE FUTURE
CANCEL TECH
LAWS
WORN OUT PLACES, WORN OUT FACES
REGULATION = ARMAGEDDON
BRIGHT AND EARLY FOR THEIR DAILY RACES
GOING NOWHERE, GOING NOWHERE
IT'S A VERY, VERY, MAD WORLD

IT REALLY IS A MAD WORLD. AND IT'S DRIVING US PARTICULARLY CRAZY BECAUSE WE'VE BECOME SO USED TO SEEING THE WORLD IN EXTREMES.

YOU CAN EITHER BE A **TECHNO-BASHER** OR A **TECH-OPTIMIST** AND IF YOU ARE ONE YOU **CANNOT** AND **SHALL NOT** SYMPATHIZE WITH THE OTHER SIDE.



GIVE AI THE REIGNS TO RUN THE ENTIRE WORLD OR PILE IT ALL UP AND THROW IT ALL OUT.

WE'VE BECOME SO USED TO **'HULKING-OUT'** AT THE FIRST SIGN OF DISAGREEMENT ON SOCIAL MEDIA,

THAT THE ENTIRE DISCOURSE AROUND TECH, AND AI IN PARTICULAR HAS BEEN COMPLETELY STRIPPED OF SUBTLETY.

IT'S 2020.

HOW IS IT THAT WE CAN APPRECIATE A COMEDIC TAKE ON HITLER AND THE NAZI YOUTH CAMPS (17), WITHOUT GETTING OUR FEELINGS HURT...

...BUT WE CAN'T HAVE ONE DISCUSSION ABOUT BIAS IN THE DATA WITHOUT IT IMMEDIATELY DEVOLVING INTO BLOWS.

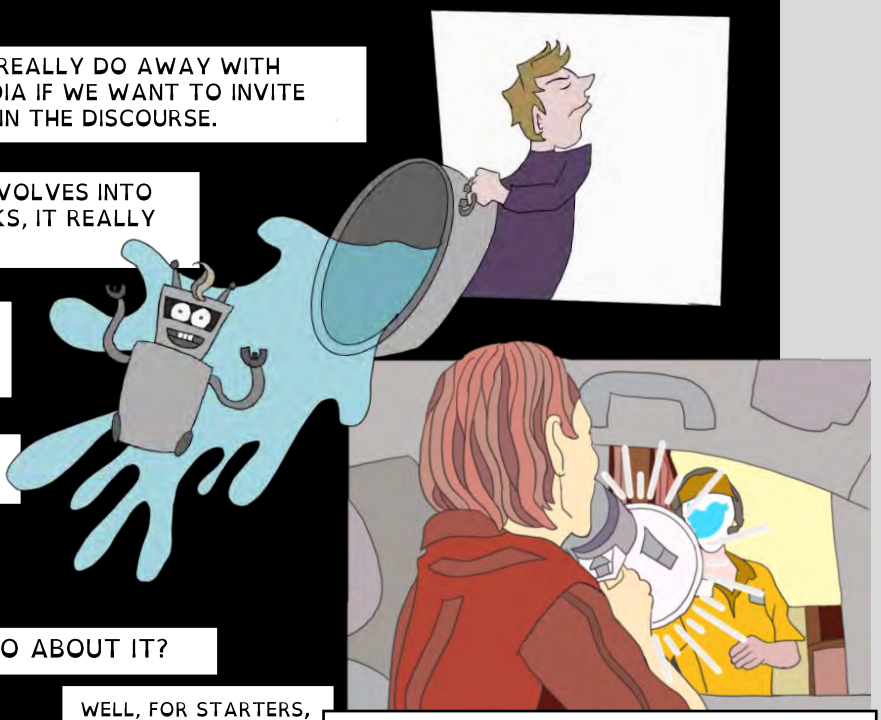
MAYBE WE NEED TO STOP REACTING TO EVERYTHING WE READ AND INSTEAD TAKE A MOMENT TO RE-READ, THINK DEEPLY AND THEN RESPOND.

BECAUSE THE TRUTH IS, WE CAN'T REALLY DO AWAY WITH THESE DISCUSSIONS ON SOCIAL MEDIA IF WE WANT TO INVITE THE GENERAL PUBLIC TO PARTAKE IN THE DISCOURSE.

BUT WHEN A DISCUSSION QUICKLY DEVOLVES INTO GASLIGHTING AND PERSONAL ATTACKS, IT REALLY DOESN'T BENEFIT ANYONE.

THE EXTANT CELEBRITY CULTURE AND INTERNET TROLLING THAT SHROUDS SCIENTIFIC DISCUSSIONS NEEDS TO GO!

OR ELSE WE JUST END UP THROWING THE BABY OUT WITH THE BATHWATER



SO, WHAT DO WE DO ABOUT IT?

WELL, FOR STARTERS,

CAN WE GET SOME ***NUANCE*** WITH OUR DISCUSSION MEAL, PLEASE!?!

HERE IS A MORE NUANCED TAKE ON WHETHER AI LEADS TO A **UTOPIA** OR A ***DYSTOPIA:***

FOR STARTERS, **THERE IS RARELY AN *OBJECTIVE TRUTH*!** MORE OFTEN THAN NOT, THE EFFICACY OF A MODEL DEPENDS ON THE **CONTEXT** FOR WHICH IT WAS DESIGNED

THE **"GROUND TRUTH"** THAT WE PRETEND EXISTS, AND AGAINST WHICH WE MEASURE MODEL ACCURACY, IS JUST THE **CLOTHES** THAT THE **ML EMPEROR** IS **NOT** WEARING!

THE ENGINEERING MINDSET IS TO TAKE THE CLASS LABELS AS GOSPEL AND BLINDLY TRY TO OPTIMIZE FOR THEM.

BUT CLASS LABELS ARE JUST **PROXIES** FOR **UNDERLYING SOCIAL PHENOMENA** AND NO AMOUNT OF **MATHEMATICAL FORMALIZATION** WILL TURN **SOCIAL CONSTRUCTS** INTO **OBJECTIVE TRUTHS.**

THE REALITY IS THAT **ALL** MODELS ARE **WRONG**. **SOME** MODELS ARE **USEFUL**!

IN THIS ART GALLERY, EACH PAINTING DEPICTS AN **APPLE.** BUT ONLY ONE OF THEM IS POTENTIALLY USEFUL AS A **REAL-LIFE APPLE DETECTOR**

WE OFTEN FIND IT HARD TO JUDGE WHICH MODEL IS MOST USEFUL, BECAUSE THAT REQUIRES DEEP **DOMAIN EXPERTISE.**

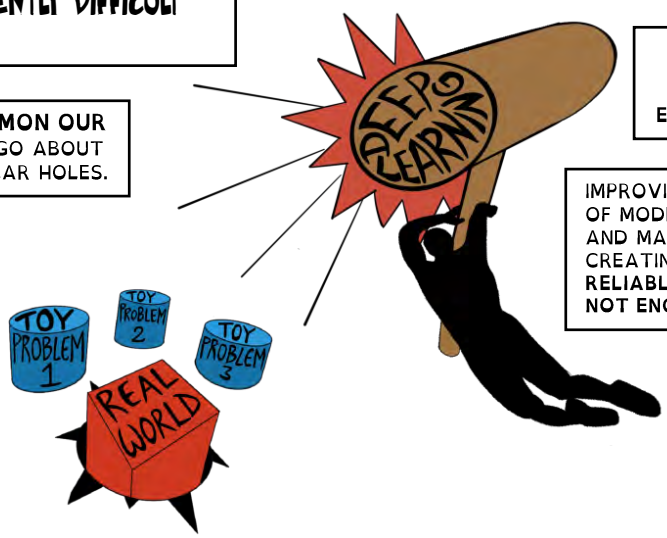
WE HAVE BEEN **DANGEROUSLY CONFLATING** EXPERTISE IN TRAINING AND DEPLOYING A MODEL WITH DOMAIN EXPERTISE.

INSTEAD WE SHOULD **ACKNOWLEDGE THE LIMITATION OF OUR EXPERTISE** AS SCIENTISTS AND ENGINEERS AND **INVITE THE TRUE DOMAIN EXPERTS** TO COME TO THE TABLE.

SOME **CONTEXTS** ARE ***INHERENTLY DIFFICULT*** TO BUILD FOR.

WE HAVE THE TENDENCY **TO SUMMON OUR DEEP LEARNING HAMMER** AND GO ABOUT NAILING SQUARE PEGS INTO CIRCULAR HOLES.

UNFORTUNATELY, THE MOST PROMISING RESULTS THAT YOU READ ABOUT WERE OBTAINED ON **TOY PROBLEMS** WITHIN **EXPERIMENTAL SET-UPS** AND ARE NOT DESIGNED TO SCALE TO THE REAL WORLD.



THE WORLD IS A COMPLICATED AND MESSY PLACE AND THE **LIMITED PERFORMANCE OF OUR EXISTING MODELS** REFLECTS THAT.

IMPROVING **GENERALIZATION ABILITY** OF MODELS IS A HOT AREA OF RESEARCH AND MAYBE WE'LL GET AROUND TO CREATING MODELS THAT CAN **PERFORM RELIABLY** IN **CONTEXTS THAT THEY DID NOT ENCOUNTER DURING TRAINING.**

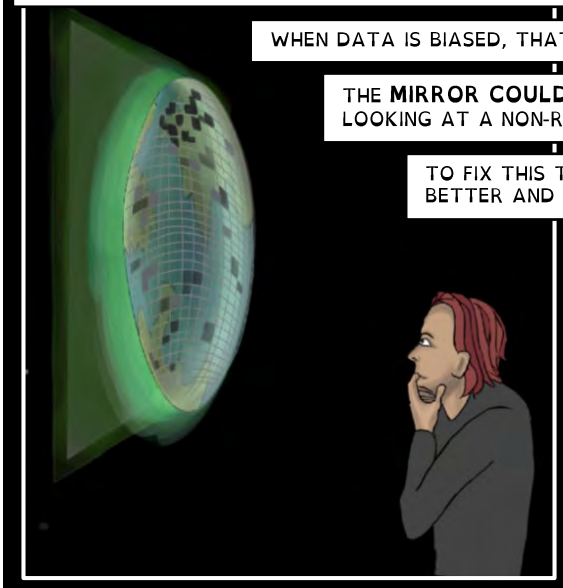
BUT WE AREN'T THERE YET.

THE OVERWHELMING MAJORITY OF PROBLEMS THAT PLAGUE AI TODAY ARE NOT BECAUSE OF *JUST* THE DATA OR *JUST* THE ALGORITHM IN ITSELF

BUT BECAUSE OF ONE CRITICAL ***CONFOUNDING FACTOR*** THAT WE KEEP OVERLOOKING:

THE WORLD

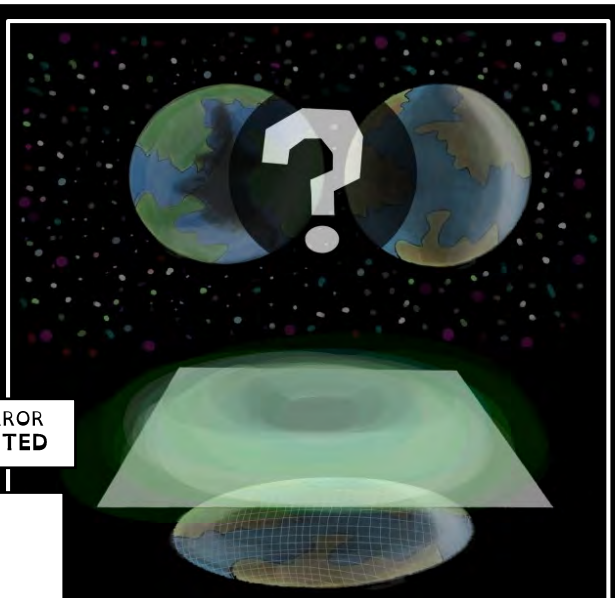
DATA IS A MIRROR REFLECTION OF THE WORLD (18)



WHEN DATA IS BIASED, THAT REFLECTION IS DISTORTED. THERE ARE SEVERAL EXPLANATIONS FOR THIS

THE **MIRROR COULD BE DISTORTED**: WE COULD BE COLLECTING THE WRONG DATA, OR LOOKING AT A NON-REPRESENTATIVE SAMPLE

TO FIX THIS TYPE OF BIAS, WE CAN ATTEMPT FIXING THE MIRROR TO COLLECT BETTER AND CLEANER DATA



BUT THERE'S ALSO THE POSSIBILITY THAT THE MIRROR IS PERFECT AND **THE WORLD ITSELF IS DISTORTED**

WE TEND TO UNDER-APPRECIATE THIS POSSIBILITY BECAUSE WE INSTINCTIVELY COMPARE THE REFLECTION (DATA) WITH **HOW WE WANT THE WORLD TO BE**, RATHER THAN WITH **HOW IT ACTUALLY IS!**

BASED ON THE REFLECTION, AND WITHOUT KNOWLEDGE OR **ASSUMPTIONS** ABOUT THE PROPERTIES OF THE MIRROR AND OF THE WORLD IT REFLECTS, WE **CANNOT KNOW** WHETHER THE REFLECTION IS DISTORTED, AND, IF SO, FOR WHAT REASON.

DATA ALONE **CANNOT** TELL US WHETHER IT IS A DISTORTED REFLECTION OF A PERFECT WORLD, OR A PERFECT REFLECTION OF A DISTORTED WORLD, OR WHETHER THESE **DISTORTIONS COMPOUND.**

CHANGING THE **REFLECTION** *DOES NOT* CHANGE THE **WORLD.**

WE'VE COME UP WITH BETTER WAYS TO COLLECT DATA, CLEAN IT AND REMOVE SOME OF ITS BIAS.

BUT, ALL OF THESE FIXES ARE **APPLIED ON THE MIRROR** OR ON THE **REFLECTION** AND THEY **DO NOT PROPAGATE BACK** TO CHANGE THE **WORLD.**

THE **UNDERLYING SOCIETAL INEQUITIES** THAT GIVE RISE TO DISCRIMINATORY OUTCOMES **REMAIN INTACT** IF WE **ONLY INTERVENE ON THE DATA.**

HENCE, OUR **INTERVENTION** SHOULD EXPAND *BEYOND* TECHNOLOGICAL SOLUTIONS, TOWARDS **SYSTEMIC CHANGE.**

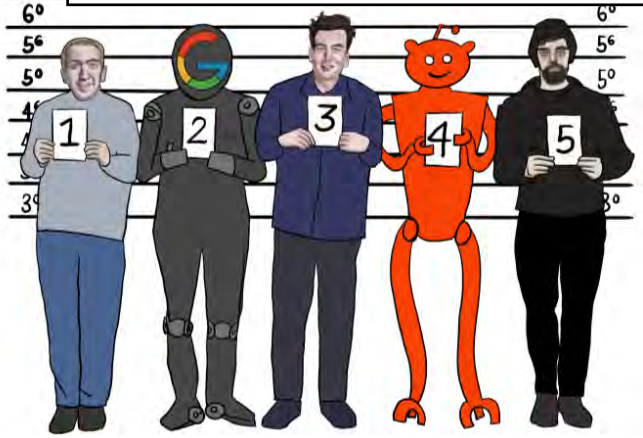
PREDICTION IS DIFFICULT, ESPECIALLY ABOUT THE ***FUTURE***! (19)

WHEN THINGS (INEVITABLY) GO WRONG, WHO IS **RESPONSIBLE**?

IT CANNOT BE THE ALGORITHM.

BUT GIVEN THE MANY STAKEHOLDERS THAT PLAY A PART IN THE CREATION AND OPERATION OF A SOFTWARE PRODUCT,

HOW DO WE DETERMINE WHICH **HUMAN** IS CULPABLE? ARE THEY ALL?



I KNOW WHAT YOU'RE THINKING...

"I SEE WHERE YOU'RE GOING WITH THIS... YOU'RE NOT SERIOUSLY GOING TO GET INTO REGULATION NOW, ARE YOU?"

WELL...TIME TO REMIND YOU OF OUR RECOMMENDED APPROACH TO THINKING ABOUT AI.

REMEMBER, **NUANCE**?!

RIGHT NOW, SILICON VALLEY WILL HAVE YOU BELIEVE THAT TECHNOLOGY NEEDS TO BE ALLOWED TO RUN FREE. REGULATION IS A CATASTROPHE OF COSMIC PROPORTIONS AND WOULD BE THE END OF THE INTERNET, AND BY EXTENSION, INNOVATION AND PROGRESS.

THE FACT OF THE MATTER IS, WE PUT OUR CHILDREN ON THE AI HYPE-BIKE AND SENT THEM OFF AT FULL SPEED.

WE WERE TOO BRASH IN OUR RAPID ADOPTION OF AI AND IT HAS LED TO SOME TERRIBLE OUTCOMES WITH VERY REAL IMPACTS ON PEOPLE'S LIVES.

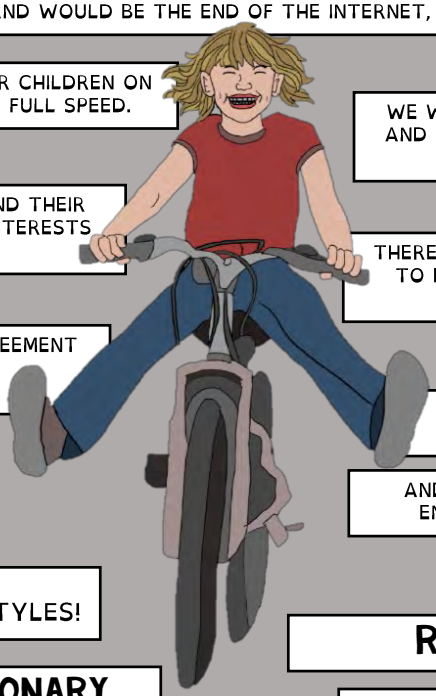
AND SO WHILE TECH COMPANIES AND THEIR CELEBRITY CEOS PROTECT THEIR INTERESTS BY BAD MOUTHING REGULATION,

THERE'S REALLY NO EXCUSE FOR THE GENERAL PUBLIC TO BUY INTO THIS NARRATIVE AND BE COMPLICIT IN THE VANDALISM OF OUR MORAL SOCIAL FIBER.

WE NEED TO COME TO AN AGREEMENT ON HOW TO GO ABOUT REGULATING TECHNOLOGY.

AND SO WE MUST START EDUCATING OURSELVES,

AND PARTAKE IN THIS LOFTY ENTERPRISE IN GOOD FAITH.



MAYBE IT'S TIME TO CONSIDER OTHER PARENTING STYLES!

PRECAUTIONARY

V/S

RISK-BASED

THINK OF THE OLD ADAGE **"IT'S BETTER TO BE SAFE THAN TO BE SORRY"**

THIS PRINCIPLE CALLS FOR CAUTION IN SITUATIONS OF **UNCERTAIN HARMS**, IE. THOSE THAT HAVE NOT BEEN SCIENTIFICALLY STUDIED YET.

A COMMON CRITICISM OF THIS APPROACH IS IT IS **"PARALYZING"** AND **"SELF-CANCELING"**, SINCE ANY NEW TECHNOLOGY IN ITS EARLY STAGES OF ADOPTION WOULD HAVE RISKS THAT CANNOT BE ACCOUNTED FOR.

UNDER THIS PARADIGM, REGULATE BASED ON **KNOWN** RISKS, AND MODEL THE **LIKELIHOOD** THAT THESE **RISKS** WILL LEAD TO **HARMS**

A PROMISING APPROACH IS **ALGORITHMIC IMPACT ASSESSMENT (AIA)** - A FRAMEWORK THAT HELPS UNDERSTAND AND REDUCE THE RISKS TO INDIVIDUALS AND COMMUNITIES

UNDER AIA, THE **LIKELIHOOD AND SEVERITY OF HARM** DETERMINES THE **LEVEL OF OVERSIGHT.** THE HIGHER THE RISK OF HARM, AND THE MORE SIGNIFICANT THE HARM ITSELF, THE MORE STRINGENT THE OVERSIGHT REQUIREMENTS. AND THE LESS AUTONOMY IS GRANTED TO THE AUTOMATED SYSTEM: A HUMAN MUST BE BROUGHT INTO THE LOOP TO TAKE RESPONSIBILITY FOR IMPACTFUL DECISIONS

AIA WILL ONLY WORK IF THE RISKS ARE KNOWN. THIS GIVES EACH AND EVERY ONE OF US THE OPPORTUNITY TO **BE A PART OF THE CHANGE**! NOW'S THE TIME TO **GET INVOLVED IN PUBLIC CONSULTATIONS**, TO MAKE YOUR CONCERNS HEARD!

IF WE WANT OUR ATTEMPTS AT REGULATION TO BE *TRULY EFFECTIVE*, WE NEED TO **RECONCILE** SOME INHERENT DISAGREEMENTS BETWEEN TECH AND LAW.

FOR STARTERS, HOW DO WE MAKE SURE THE LAW **KEEPS UP** WITH THE **RAPIDLY EVOLVING** SOCIO-TECHNOLOGICAL LANDSCAPE?

ANOTHER MAJOR PROBLEM IS ***HOW*** DO WE REGULATE?

NOTIONS SUCH AS **FAIRNESS, ACCOUNTABILITY AND INTERPRETABILITY** HAVE BECOME THE POSTER CHILDREN FOR AI POLICY. BUT THEY STILL DON'T HAVE UNIVERSALLY ACCEPTED TECHNICAL MANIFESTATIONS.

WHY? BECAUSE AMBIGUITY IN DEFINITIONS IS AN INTENTIONALLY WIELDED TOOL THAT ALLOWS FOR **INTERPRETIVE** AND **CONTEXTUAL** READINGS OF **LAW**

BUT THE VERY SAME AMBIGUITY IS CATASTROPHIC FOR **TECH**, WHICH RELIES ENTIRELY ON **MATHEMATICAL FORMALIZATIONS THAT CAN BE WRITTEN INTO CODE**

AND FOR **REGULATORS** WHO NEED **PRECISE DEFINITIONS** TO BUILD RULES AND POLICIES

TO COME UP WITH GOOD DEFINITIONS, WE NEED EXAMPLES OF SYSTEMS THAT ARE USED **TODAY**!

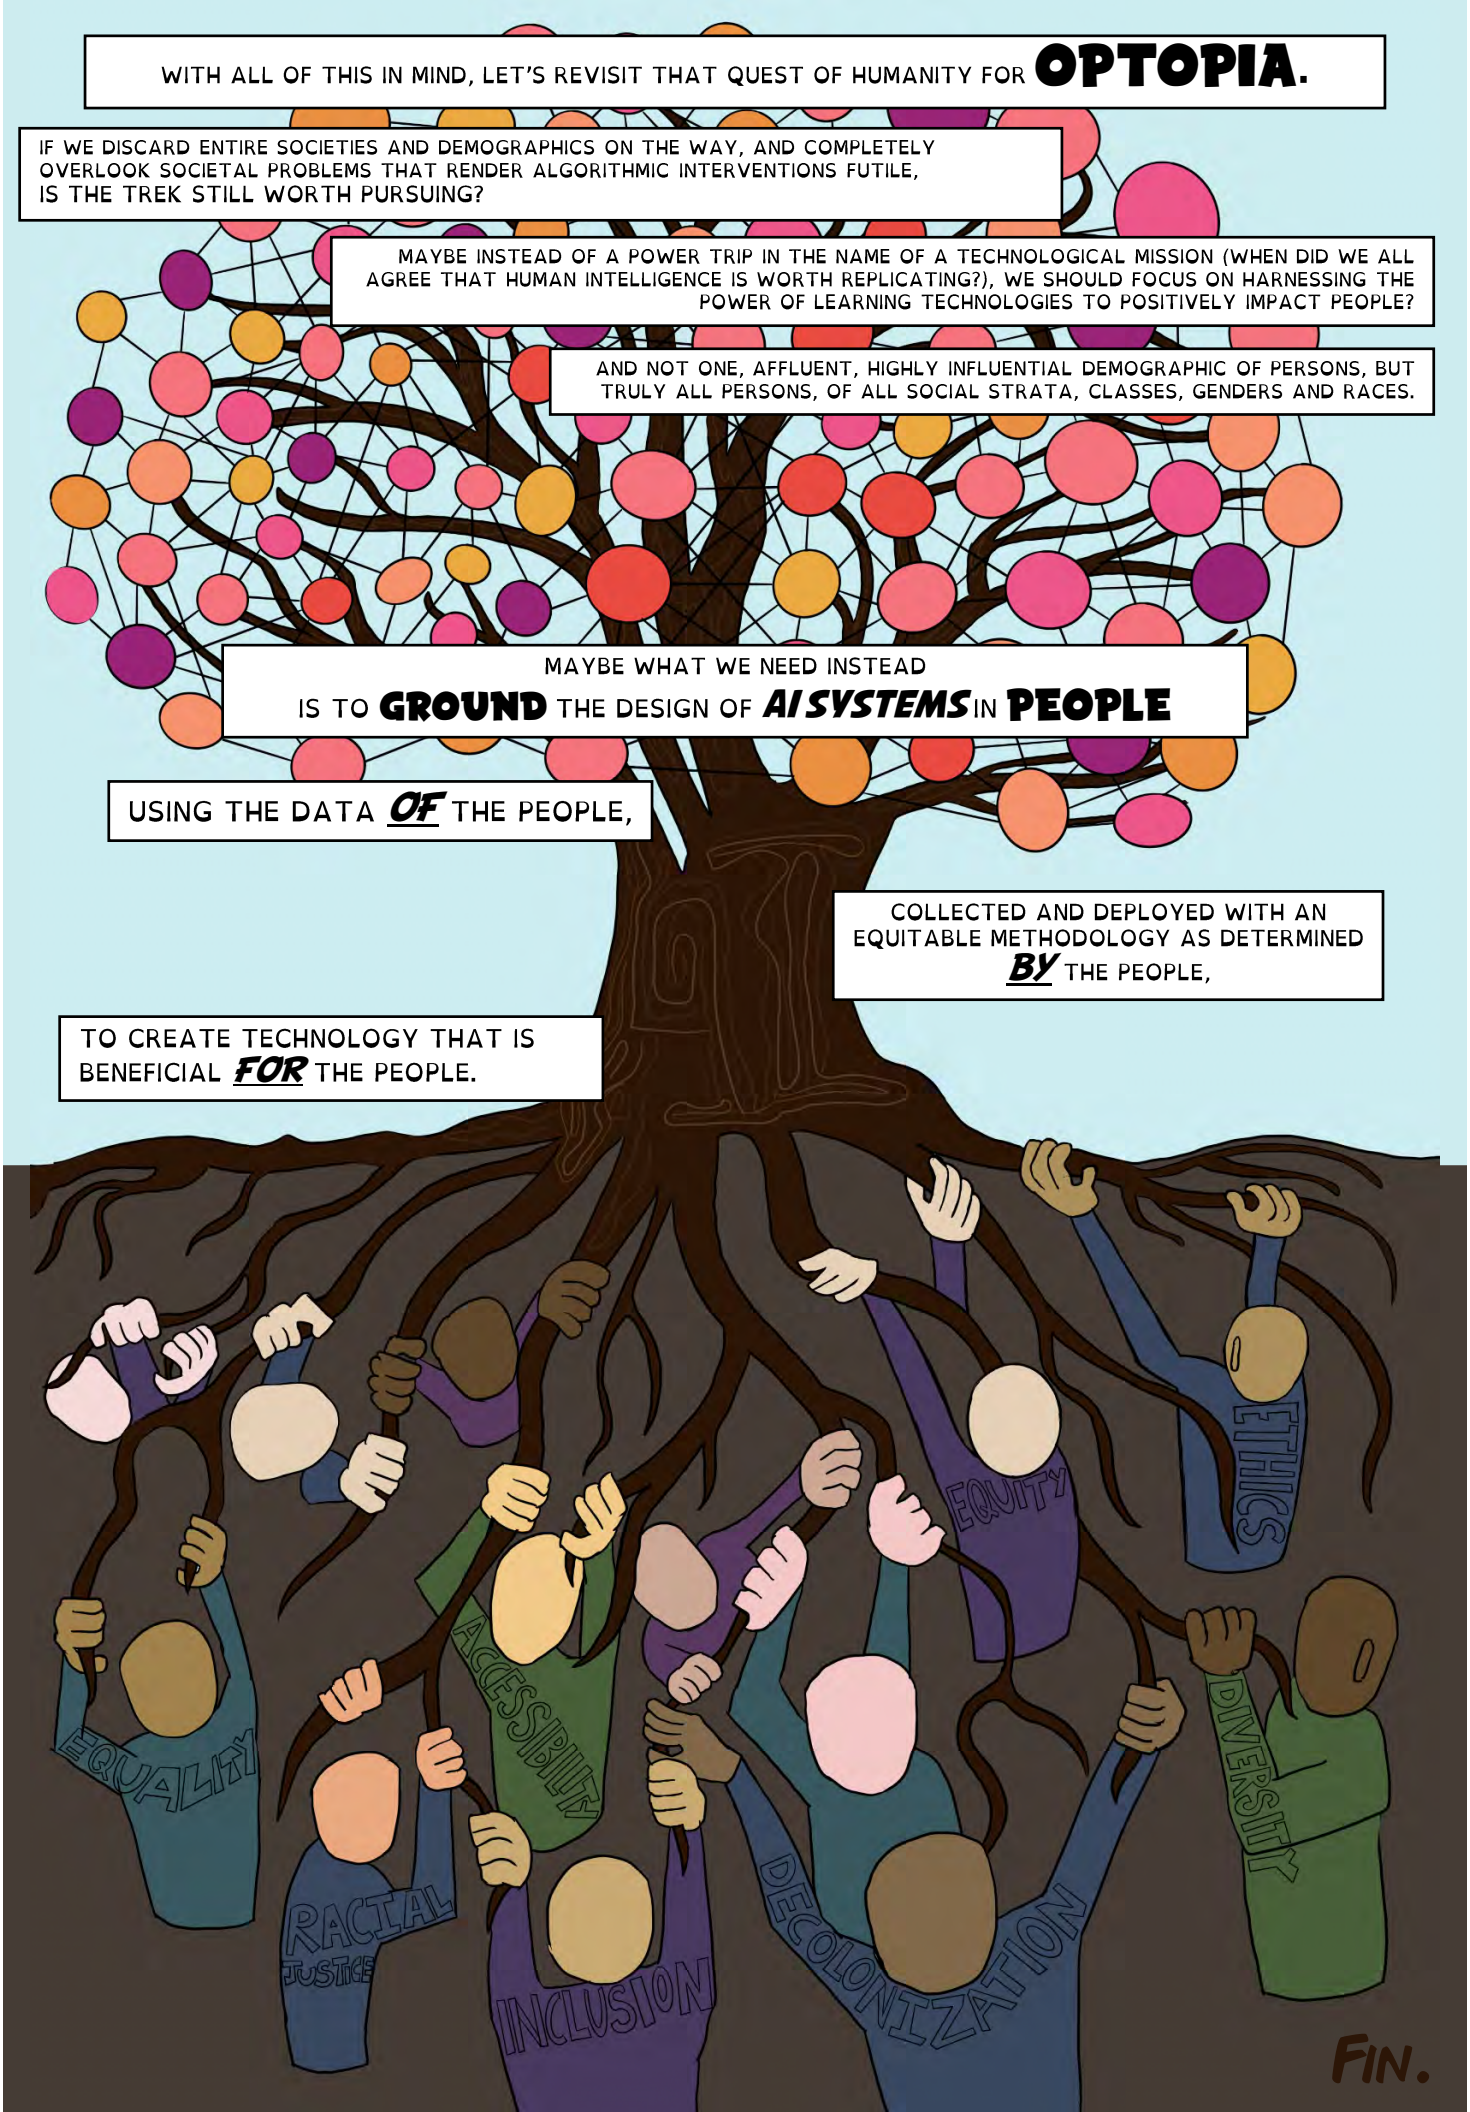
TAKE THE **NYC AUTOMATED DECISION SYSTEMS (ADS) TASK FORCE**, THE FIRST OF ITS KIND IN THE U.S., ENVISIONED TO BE THE BEACON FOR **TRANSPARENCY** AND **EXPERT INSIGHT** INTO THE USE OF ALGORITHMS TO AID DECISION-MAKING BY CITY AGENCIES. (20)

BUT THEY DIDN'T GET VERY FAR.

A **GOOD DEFINITION** WAS LACKING, AS WERE **EXAMPLES**.

WHAT IS AN ADS?

A CALCULATOR IS NOT AN ADS. BUT A SYSTEM THAT COLLECTS DATA, BUILDS A MODEL, AND THEN ENACTS POLICY THAT IMPACTS PEOPLE'S LIVES-ALLOCATES SCHOOL BUDGETS, OR OFFERS HOMELESSNESS ASSISTANCE, OR MATCHES STUDENTS WITH SPOTS IN HIGH SCHOOLS-CERTAINLY IS.



WITH ALL OF THIS IN MIND, LET'S REVISIT THAT QUEST OF HUMANITY FOR OPTOPIA.
IF WE DISCARD ENTIRE SOCIETIES AND DEMOGRAPHICS ON THE WAY, AND COMPLETELY OVERLOOK SOCIETAL PROBLEMS THAT RENDER ALGORITHMIC INTERVENTIONS FUTILE, IS THE TREK STILL WORTH PURSUING?
MAYBE INSTEAD OF A POWER TRIP IN THE NAME OF A TECHNOLOGICAL MISSION (WHEN DID WE ALL AGREE THAT HUMAN INTELLIGENCE IS WORTH REPLICATING?), WE SHOULD FOCUS ON HARNESSING THE POWER OF LEARNING TECHNOLOGIES TO POSITIVELY IMPACT PEOPLE?
AND NOT ONE, AFFLUENT, HIGHLY INFLUENTIAL DEMOGRAPHIC OF PERSONS, BUT TRULY ALL PERSONS, OF ALL SOCIAL STRATA, CLASSES, GENDERS AND RACES.
MAYBE WHAT WE NEED INSTEAD
IS TO GROUND THE DESIGN OF AI SYSTEMS IN PEOPLE
USING THE DATA OF THE PEOPLE,
COLLECTED AND DEPLOYED WITH AN EQUITABLE METHODOLOGY AS DETERMINED BY THE PEOPLE,
TO CREATE TECHNOLOGY THAT IS BENEFICIAL FOR THE PEOPLE.
EQUALITY
ACCESSIBILITY
EQUITY
ETHICS
RACIAL JUSTICE
INCLUSION
DECOLONIZATION
DIVERSITY
FIN.

ABOUT

FALAAH is a Scientist/Engineer by training and an Artist by nature, chasing a passion for building Robust and Ethical ML all the way from industry to academia. In the face of having to incessantly remind everyone around her about the limitations of current ML capabilities, Falaah started "**MACHINELEARNIST COMICS**" - online Scientific Comics about the AI Landscape.

JULIA is an Assistant Professor of Computer Science and Engineering and of Data Science at NYU. She is passionate about Responsible Data Science and leads the "***DATA, RESPONSIBLY***" project, the latest offering of which is the inimitable, interdisciplinary course on **RESPONSIBLE DATA SCIENCE**.

With the *undecipherable alchemy* that is grad-school admissions, the **Cosmos** brought these two creative minds together and thus was born: **DATA, RESPONSIBLY COMICS**!

Whether you're a **Student**, unsure about where to get started in the sea of ML scholarship; or an **Educator**, looking for a fun new pedagogical instrument for your students; or a **Practitioner**, looking for some relatable content about all the idiosyncrasies of the current AI landscape; or just a good ol' John/Jane Doe who likes to read comics and is intrigued by the prospect of a long form scientific volume, Data, Responsibly Comics are for you!

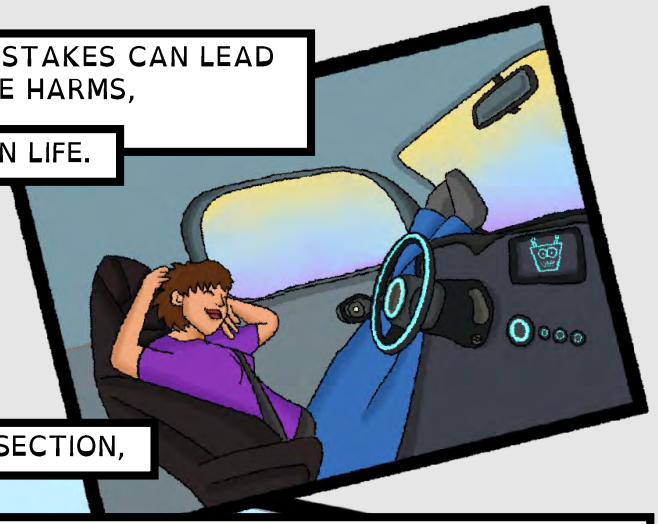
PREDICTION IS DIFFICULT, ESPECIALLY OF THE FUTURE.
DIFFICULT AS IT IS - BECAUSE OF THE UNCERTAINTY AND COMPLEXITY OF THE WORLD - PREDICTING THE FUTURE IS OFTEN THE JOB OF AI.
AND BECAUSE THIS TASK IS DIFFICULT - AND AT TIMES EVEN IMPOSSIBLE - AI SYSTEMS WILL MAKE MISTAKES.
FOR EXAMPLE, A SMART LIGHT AI MAY INCORRECTLY GUESS WHETHER THE LIGHT SHOULD BE ON OR OFF.
TURNING ON THE LIGHT IN THE MIDDLE OF THE NIGHT WILL WAKE YOU UP.
AND LEAVING IT ON SYSTEMATICALLY WILL LEAVE YOU TO FOOT A HIGH ENERGY BILL.
AS ANOTHER EXAMPLE, A CUSTOMER SERVICE AI AT YOUR FAVORITE SHOE STORE MAY MISUNDERSTAND YOUR ORDER,
...AND THE WRONG PAIR OF SHOES WILL BE SHIPPED TO YOU.
ANNOYING AS THEY MAY BE, THESE ARE MISTAKES WITH LOW STAKES.
CONSEQUENCES OF SUCH MISTAKES ARE NOT SEVERE, AND THEY ARE REVERSIBLE.

HOWEVER, THERE ARE CASES WHERE MISTAKES CAN LEAD TO CATASTROPHIC IRREVERSIBLE HARMS,

...EVEN TO THE LOSS OF HUMAN LIFE.



CONSIDER AN AUTONOMOUS CAR -

AN AI THAT IS ABOUT TO CROSS AN INTERSECTION,

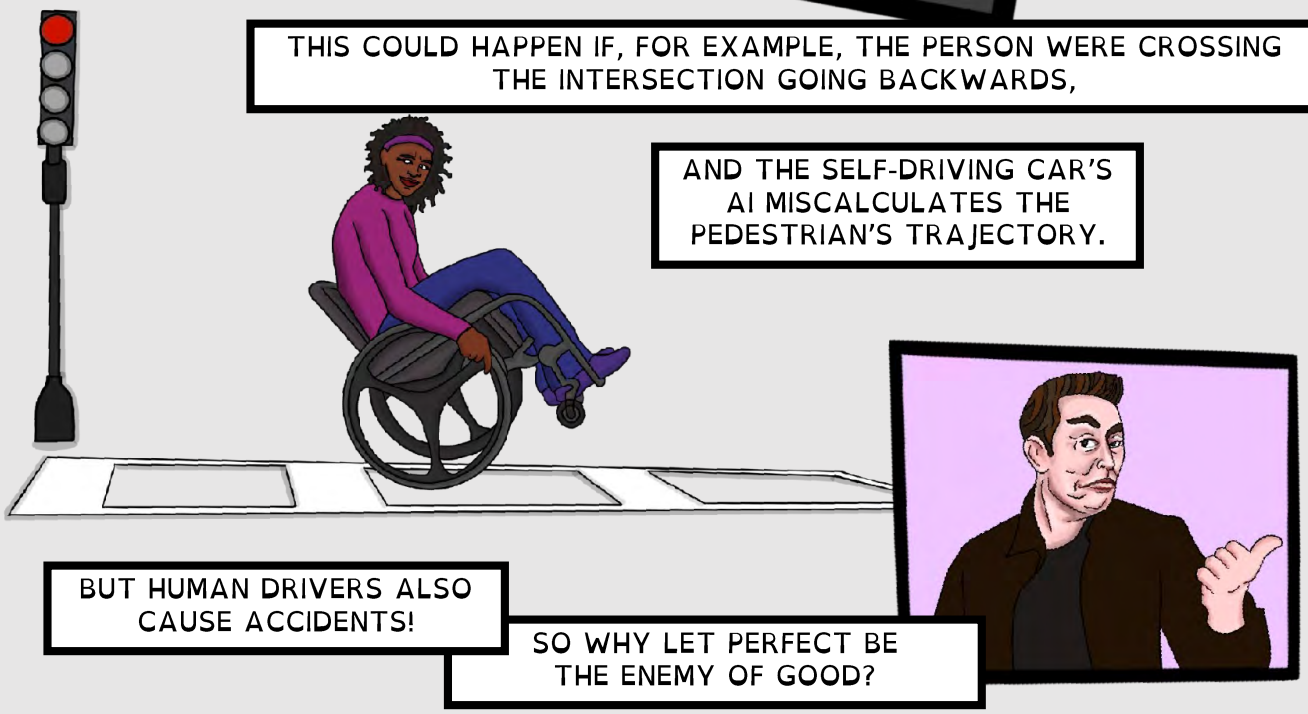
AND THAT DOES NOT RECOGNIZE A PERSON ON A BICYCLE AS ONE OF THE TYPES OF OBJECTS IT WOULD EXPECT TO SEE ON THE ROAD.

THE CAR WOULD THEN CONTINUE ON ITS PATH, RUNNING THE CYCLIST OVER.

ANOTHER EXAMPLE IS WHEN THE AUTONOMOUS CAR DOES NOT DETECT THE PRESENCE OF A PERSON IN A WHEELCHAIR CROSSING THE INTERSECTION.

THIS COULD HAPPEN IF, FOR EXAMPLE, THE PERSON WERE CROSSING THE INTERSECTION GOING BACKWARDS,

AND THE SELF-DRIVING CAR'S AI MISCALCULATES THE PEDESTRIAN'S TRAJECTORY.



BUT HUMAN DRIVERS ALSO CAUSE ACCIDENTS!

SO WHY LET PERFECT BE THE ENEMY OF GOOD?

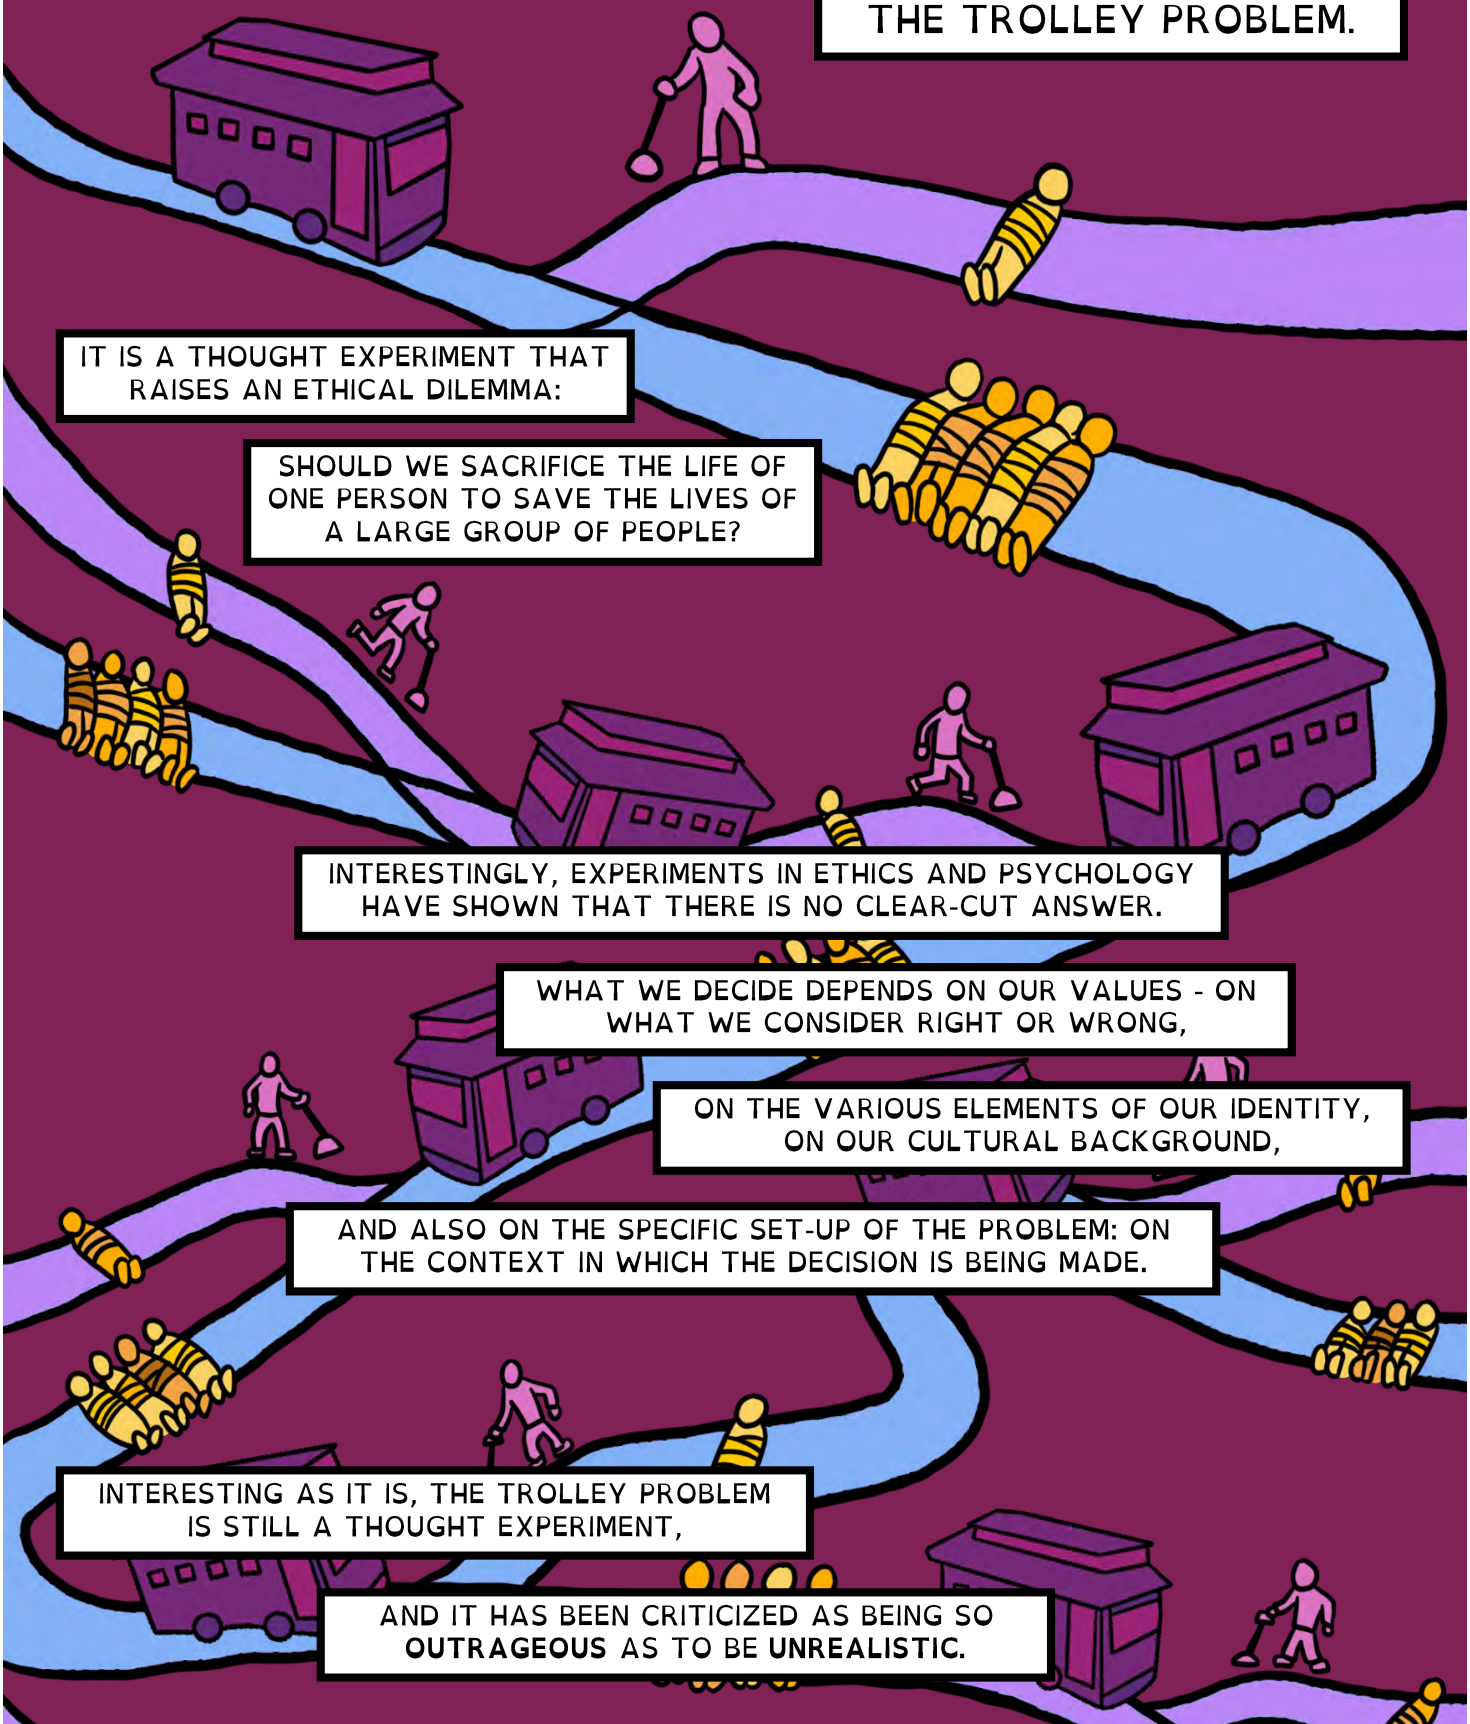
SHOULDN'T WE BE PREPARED TO SUFFER A FEW MISTAKES MADE BY AUTONOMOUS CARS IN THE NAME OF INCREASED OVERALL SAFETY OF OUR TRANSPORTATION SYSTEM, AND THE CONVENIENCE TO THE DRIVERS?

IN FACT, CAN'T WE ENCODE OUR JUDGEMENT ABOUT WHAT MISTAKES ARE MORE IMPORTANT TO AVOID, AND LET AN AI SORT OUT THE TRADE-OFFS?

CAN'T WE EQUIP OUR AI WITH VALUES?

A FAMOUS EXAMPLE THAT MAKES US THINK ABOUT OUR VALUES, AND TRADE-OFFS THEY INTRODUCE, IS

THE TROLLEY PROBLEM.



IT IS A THOUGHT EXPERIMENT THAT RAISES AN ETHICAL DILEMMA:

SHOULD WE SACRIFICE THE LIFE OF ONE PERSON TO SAVE THE LIVES OF A LARGE GROUP OF PEOPLE?

INTERESTINGLY, EXPERIMENTS IN ETHICS AND PSYCHOLOGY HAVE SHOWN THAT THERE IS NO CLEAR-CUT ANSWER.

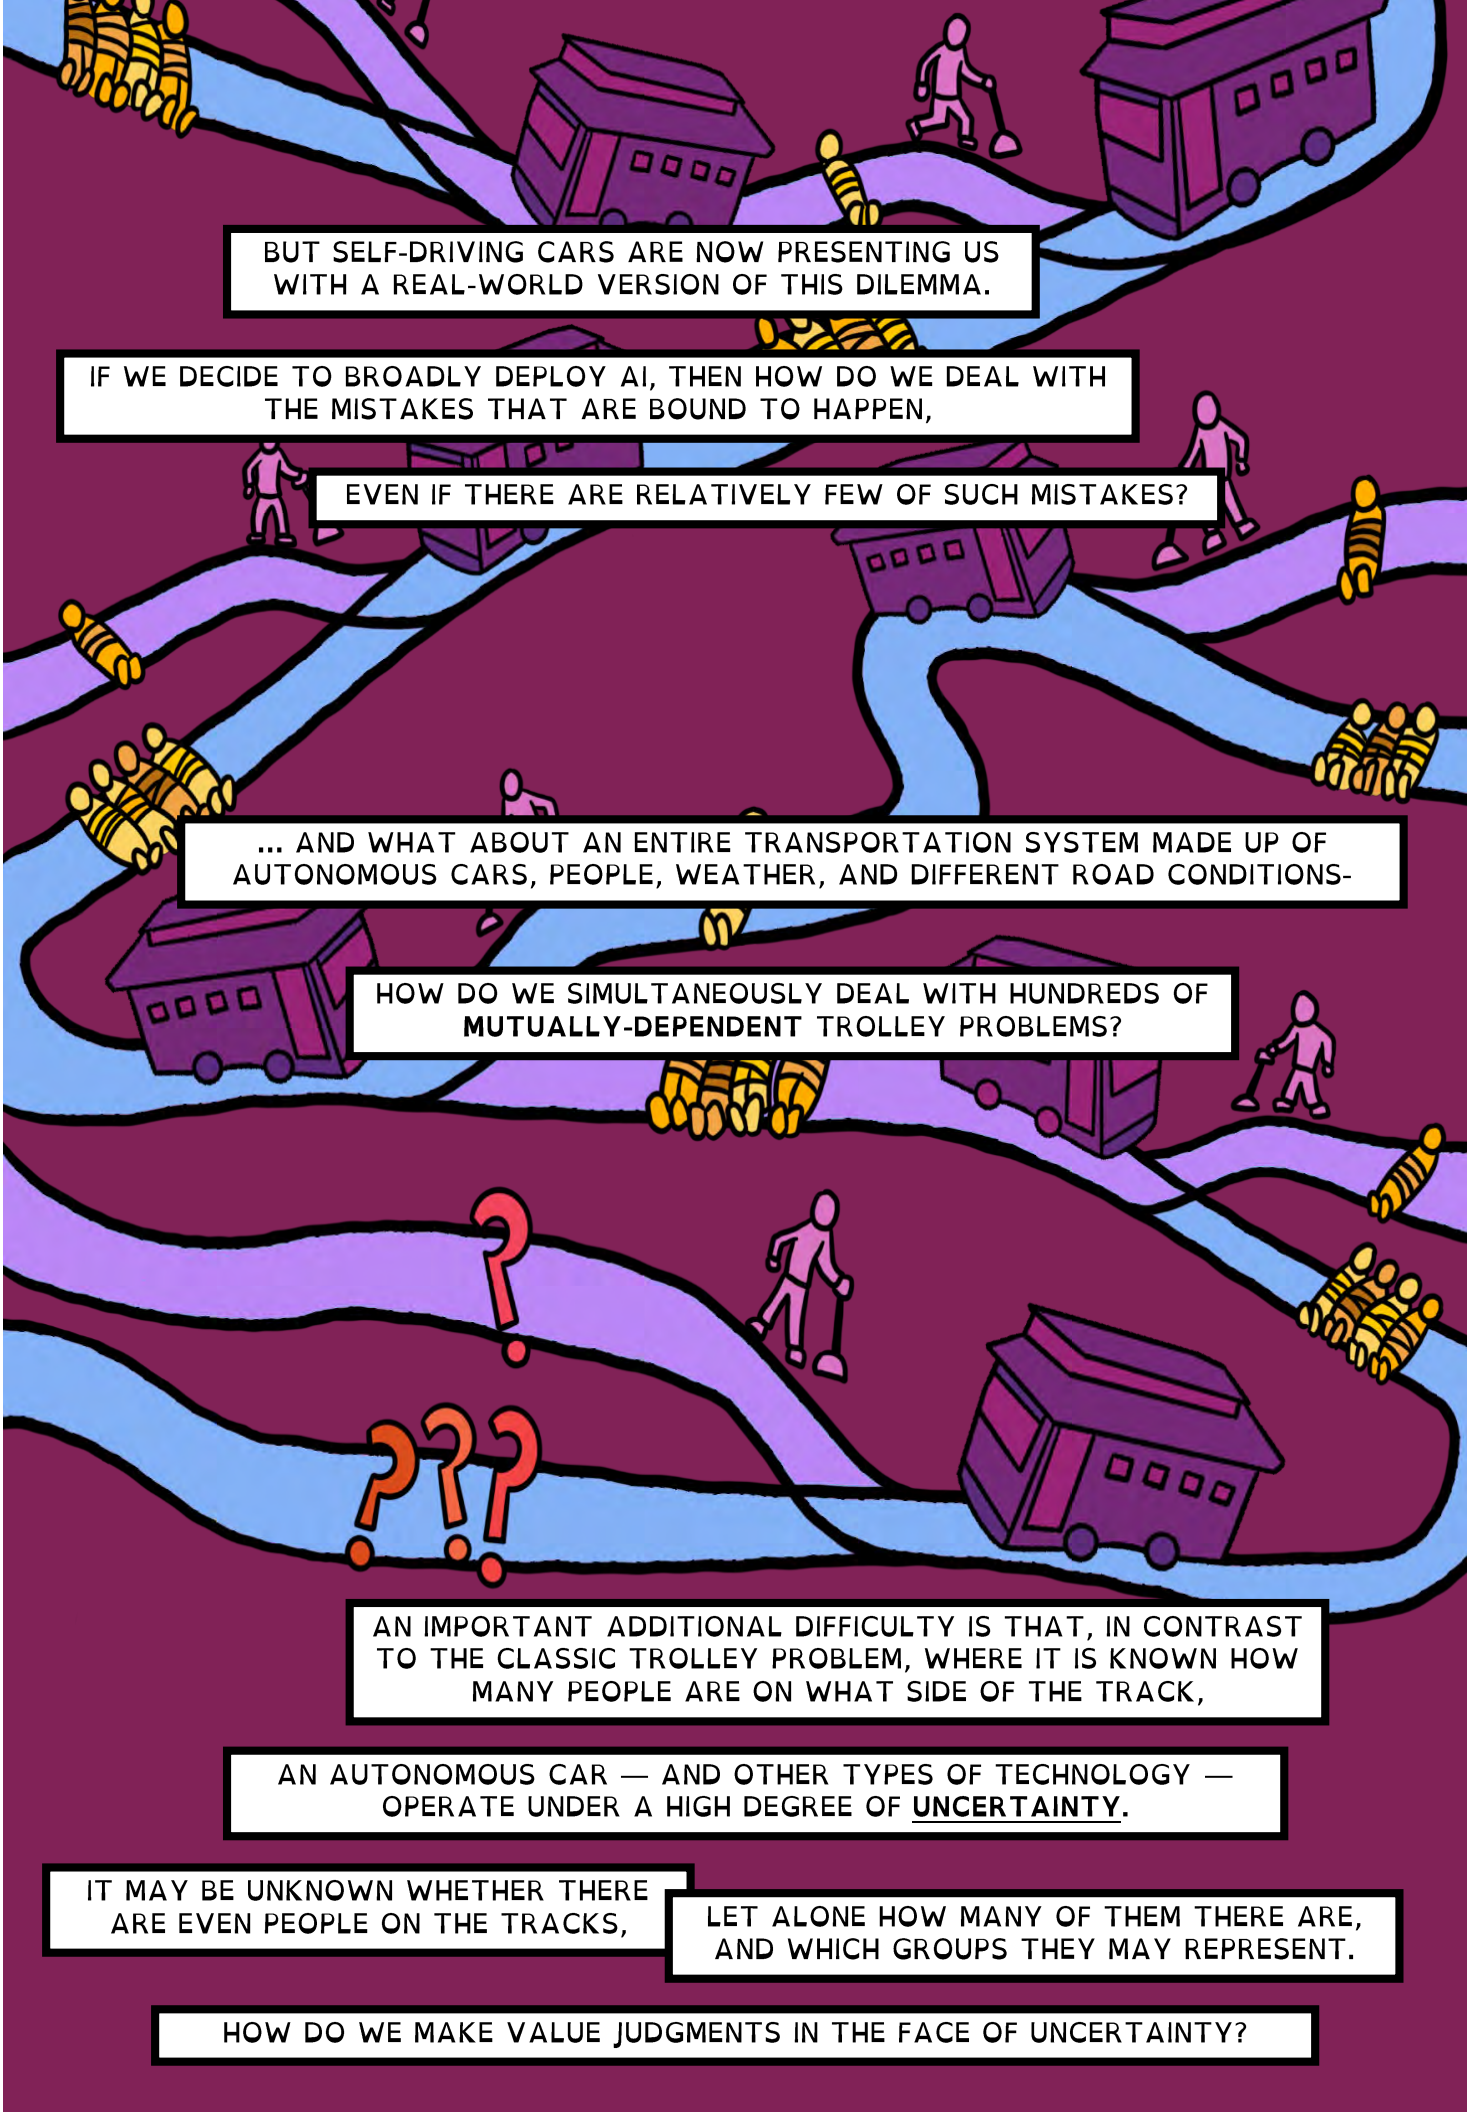
WHAT WE DECIDE DEPENDS ON OUR VALUES - ON WHAT WE CONSIDER RIGHT OR WRONG,

ON THE VARIOUS ELEMENTS OF OUR IDENTITY, ON OUR CULTURAL BACKGROUND,

AND ALSO ON THE SPECIFIC SET-UP OF THE PROBLEM: ON THE CONTEXT IN WHICH THE DECISION IS BEING MADE.

INTERESTING AS IT IS, THE TROLLEY PROBLEM IS STILL A THOUGHT EXPERIMENT,

AND IT HAS BEEN CRITICIZED AS BEING SO **OUTRAGEOUS** AS TO BE **UNREALISTIC.**



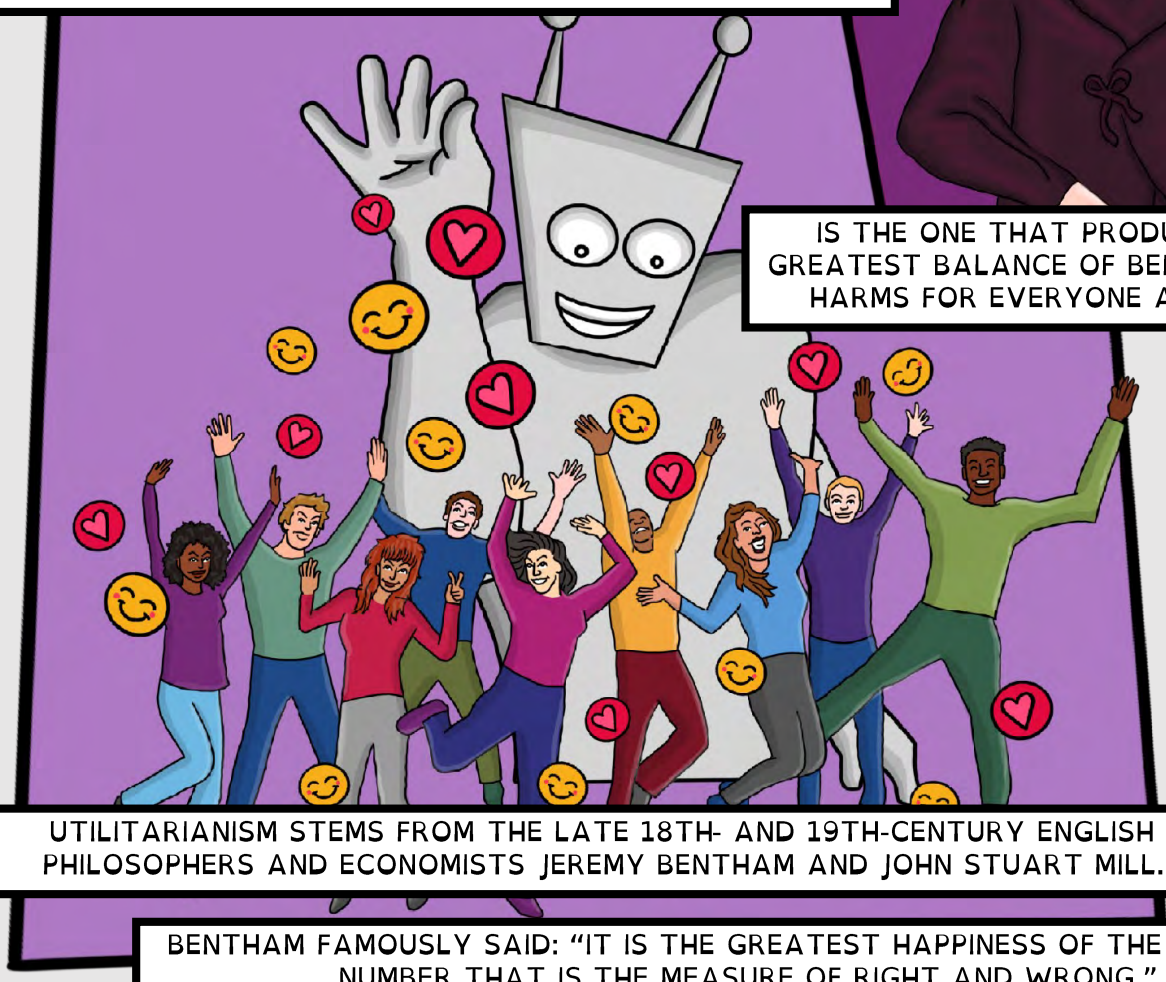
BUT SELF-DRIVING CARS ARE NOW PRESENTING US WITH A REAL-WORLD VERSION OF THIS DILEMMA.
IF WE DECIDE TO BROADLY DEPLOY AI, THEN HOW DO WE DEAL WITH THE MISTAKES THAT ARE BOUND TO HAPPEN,
EVEN IF THERE ARE RELATIVELY FEW OF SUCH MISTAKES?
... AND WHAT ABOUT AN ENTIRE TRANSPORTATION SYSTEM MADE UP OF AUTONOMOUS CARS, PEOPLE, WEATHER, AND DIFFERENT ROAD CONDITIONS-
HOW DO WE SIMULTANEOUSLY DEAL WITH HUNDREDS OF **MUTUALLY-DEPENDENT** TROLLEY PROBLEMS?
AN IMPORTANT ADDITIONAL DIFFICULTY IS THAT, IN CONTRAST TO THE CLASSIC TROLLEY PROBLEM, WHERE IT IS KNOWN HOW MANY PEOPLE ARE ON WHAT SIDE OF THE TRACK,
AN AUTONOMOUS CAR — AND OTHER TYPES OF TECHNOLOGY — OPERATE UNDER A HIGH DEGREE OF **UNCERTAINTY**.
IT MAY BE UNKNOWN WHETHER THERE ARE EVEN PEOPLE ON THE TRACKS,
LET ALONE HOW MANY OF THEM THERE ARE, AND WHICH GROUPS THEY MAY REPRESENT.
HOW DO WE MAKE VALUE JUDGMENTS IN THE FACE OF UNCERTAINTY?

THE TROLLEY CAR PROBLEM ILLUSTRATES A SPECIFIC DOCTRINE OF MORAL PHILOSOPHY -

UTILITARIANISM.

PERHAPS THIS DOCTRINE CAN OFFER US SOME GUIDANCE?

UTILITARIANISM IS A MORAL PRINCIPLE THAT HOLDS THAT THE RIGHT COURSE OF ACTION — IN ANY SITUATION —



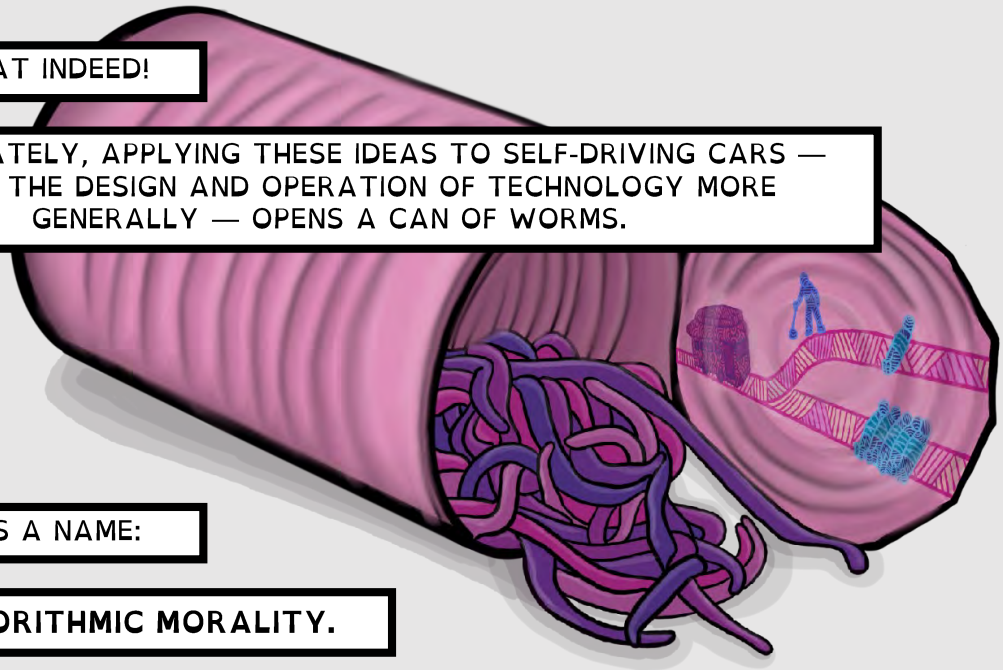
IS THE ONE THAT PRODUCES THE GREATEST BALANCE OF BENEFITS OVER HARMS FOR EVERYONE AFFECTED.

UTILITARIANISM STEMS FROM THE LATE 18TH- AND 19TH-CENTURY ENGLISH PHILOSOPHERS AND ECONOMISTS JEREMY BENTHAM AND JOHN STUART MILL.

BENTHAM FAMOUSLY SAID: "IT IS THE GREATEST HAPPINESS OF THE GREATEST NUMBER THAT IS THE MEASURE OF RIGHT AND WRONG."

SOUNDS GREAT INDEED!

UNFORTUNATELY, APPLYING THESE IDEAS TO SELF-DRIVING CARS — AND TO THE DESIGN AND OPERATION OF TECHNOLOGY MORE GENERALLY — OPENS A CAN OF WORMS.



AND IT HAS A NAME:

ALGORITHMIC MORALITY.

ALGORITHMIC MORALITY IS THE ACT OF ATTRIBUTING MORAL REASONING TO ALGORITHMS.

DOING SO IS PROBLEMATIC. HERE IS WHY.

TO START, HOW DO WE MEASURE HAPPINESS AND UNHAPPINESS?

AND HOW DO WE THEN ENCODE THESE MEASUREMENTS INTO A SET OF OBJECTIVES THAT AN ALGORITHM WILL UNDERSTAND?

THERE RARELY EXISTS A MATHEMATICAL FORMULA OR A LOGICAL STATEMENT THAT CAN CAPTURE THE BALANCE BETWEEN THE BENEFITS AND THE HARMS.

IN OTHER WORDS: THERE SIMPLY ISN'T A FORMULA FOR "RIGHT" OR "WRONG".

AND THERE ISN'T A FORMULA FOR VALUES, AND FOR HOW VALUES EMERGE AND CHANGE IN COMPLEX SOCIAL SITUATIONS.

ANOTHER REASON WHY ALGORITHMIC MORALITY IS PROBLEMATIC IS THAT,

WHEN A MISTAKE IN JUDGMENT ABOUT WHAT IS RIGHT OR WRONG IS MADE,

— AND, AS WE ALREADY KNOW, MISTAKES WILL BE MADE BECAUSE THE WORLD IS COMPLEX, UNCERTAIN, AND PERHAPS EVEN UNPREDICTABLE —

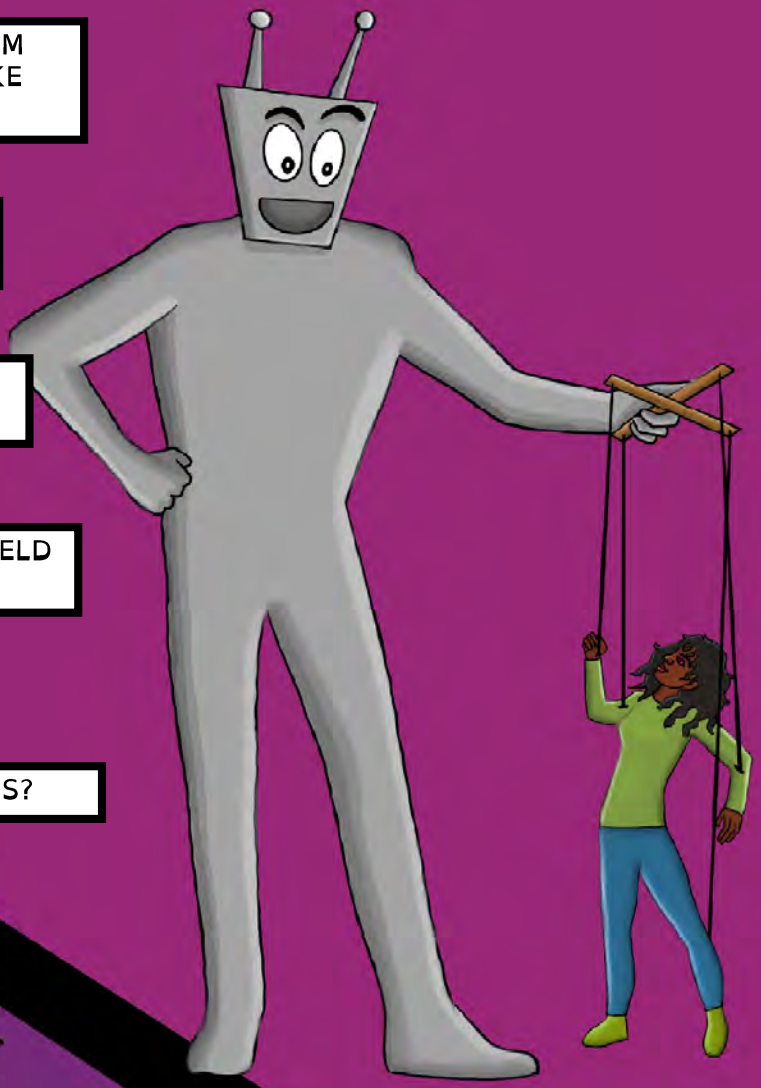
ALGORITHMIC MORALITY WOULD REQUIRE AN ALGORITHM TO TAKE RESPONSIBILITY FOR THE MISTAKE.

BUT HOLDING AN ALGORITHM RESPONSIBLE FOR A MISTAKE MAKES NO SENSE:

AN ALGORITHM DOES NOT POSSESS CONSCIOUSNESS OR FREE WILL,

IT DOES NOT MAKE AN INTENTIONAL CHOICE THAT LEADS TO A MISTAKE,

AND SO CANNOT BE HELD ACCOUNTABLE.



WHERE DOES THIS LEAVE US?

THE CAN-OPENER THAT IS THE TROLLEY PROBLEM SHOWED US THAT WE CANNOT DELEGATE ETHICS TO MACHINES.

THAT IT IS STILL UP TO US, HUMANS, TO MAKE CHOICES AND TAKE ACTIONS (OR CHOOSE NOT TO ACT),

IN ACCORDANCE WITH OUR VALUES, AND WITH EXISTING LAWS.

AND THEN IT'S UP TO US TO TAKE RESPONSIBILITY FOR THE CONSEQUENCES OF ANY MISTAKES.

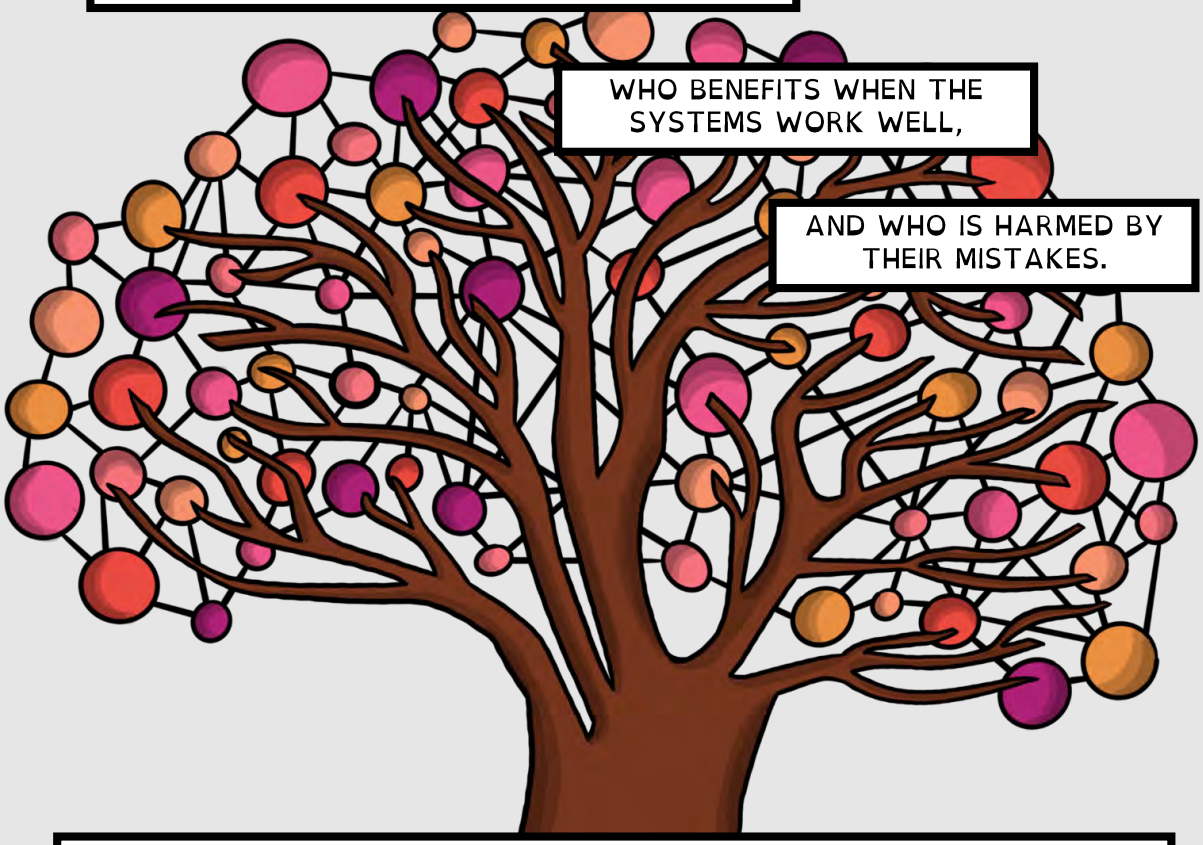
WE CANNOT OUTSOURCE THE WORK OF BEING HUMAN TO A MACHINE.

IN SUMMARY, TO EMBED ETHICS INTO SOCIO-TECHNICAL SYSTEMS SUCH AS AI,

WE MUST THINK ABOUT WHAT VALUES ARE BAKED INTO THESE SYSTEMS,

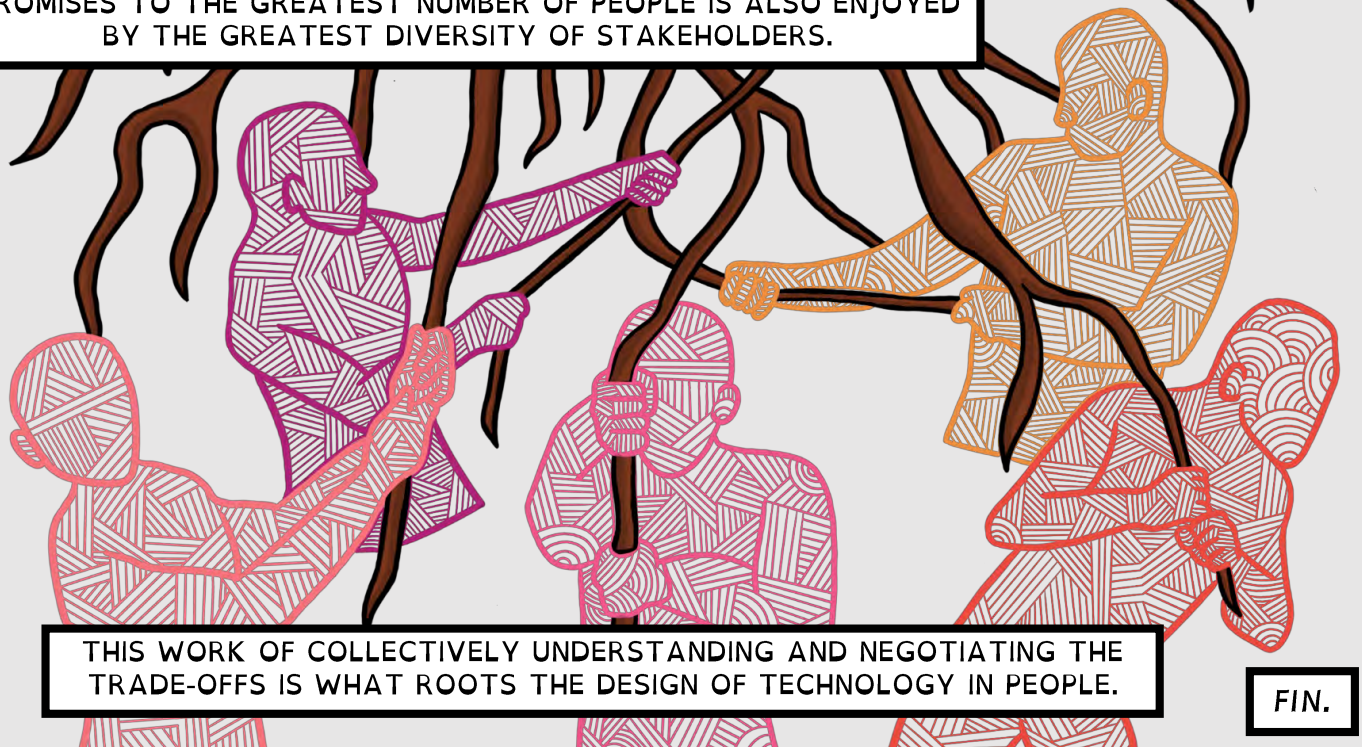
WHO BENEFITS WHEN THE SYSTEMS WORK WELL,

AND WHO IS HARMED BY THEIR MISTAKES.



AND WE MUST COLLECTIVELY TAKE RESPONSIBILITY FOR DECIDING ON THE BALANCE BETWEEN THE BENEFITS AND THE HARMS,

SO THAT "THE GREATEST HAPPINESS" THAT JEREMY BENTHAM PROMISES TO THE GREATEST NUMBER OF PEOPLE IS ALSO ENJOYED BY THE GREATEST DIVERSITY OF STAKEHOLDERS.



THIS WORK OF COLLECTIVELY UNDERSTANDING AND NEGOTIATING THE TRADE-OFFS IS WHAT ROOTS THE DESIGN OF TECHNOLOGY IN PEOPLE.

FIN.

Machine Bias

There's software used across the country to predict future criminals. And it's biased against blacks.

by Julia Angwin, Jeff Larson, Surya Mattu and Lauren Kirchner, ProPublica
May 23, 2016

ON A SPRING AFTERNOON IN 2014, Brisha Borden was running late to pick up her god-sister from school when she spotted an unlocked kid's blue Huffy bicycle and a silver Razor scooter. Borden and a friend grabbed the bike and scooter and tried to ride them down the street in the Fort Lauderdale suburb of Coral Springs.

Just as the 18-year-old girls were realizing they were too big for the tiny conveyances — which belonged to a 6-year-old boy — a woman came running after them saying, "That's my kid's stuff." Borden and her friend immediately dropped the bike and scooter and walked away.

But it was too late — a neighbor who witnessed the heist had already called the police. Borden and her friend were arrested and charged with burglary and petty theft for the items, which were valued at a total of $80.

Compare their crime with a similar one: The previous summer, 41-year-old Vernon Prater was picked up for shoplifting $86.35 worth of tools from a nearby Home Depot store.

Prater was the more seasoned criminal. He had already been convicted of armed robbery and attempted armed robbery, for which he served five years in prison, in addition to another armed robbery charge. Borden had a record, too, but it was for misdemeanors committed when she was a juvenile.

Yet something odd happened when Borden and Prater were booked into jail: A computer program spat out a score predicting the likelihood of each committing a future crime. Borden — who is black — was rated a high risk. Prater — who is white — was rated a low risk.

Two years later, we know the computer algorithm got it exactly backward. Borden has not been charged with any new crimes. Prater is serving an eight-year prison term for subsequently breaking into a warehouse and stealing thousands of dollars' worth of electronics.

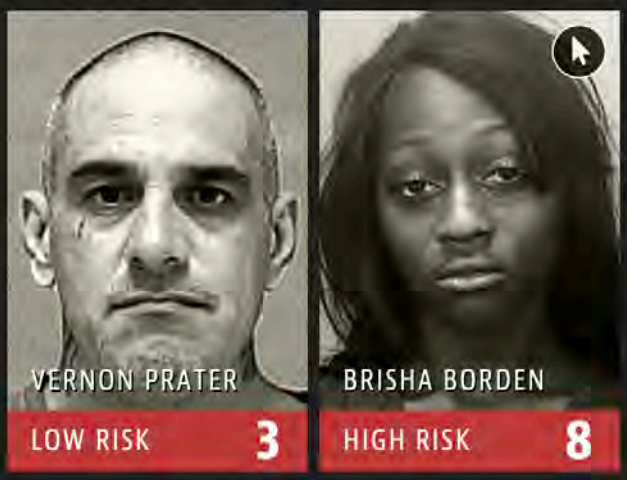
Scores like this — known as risk assessments — are increasingly common in courtrooms across the nation. They are used to inform decisions about who can be set free at every stage of the criminal justice system, from assigning bond amounts — as is the case in Fort Lauderdale — to even more fundamental decisions about defendants' freedom. In Arizona, Colorado, Delaware, Kentucky, Louisiana, Oklahoma, Virginia, Washington and Wisconsin, the results of such assessments are given to judges during criminal sentencing.

Rating a defendant's risk of future crime is often done in conjunction with an evaluation of a defendant's rehabilitation needs. The Justice Department's National Institute of Corrections now encourages the use of such combined assessments at every stage of the criminal justice process. And a landmark sentencing reform bill currently pending in Congress would mandate the use of such assessments in federal prisons.

Two Petty Theft Arrests



Borden was rated high risk for future crime after she and a friend took a kid's bike and scooter that were sitting outside. She did not reoffend.

In 2014, then U.S. Attorney General Eric Holder warned that the risk scores might be injecting bias into the courts. He called for the U.S. Sentencing Commission to study their use. "Although these measures were crafted with the best of intentions, I am concerned that they inadvertently undermine our efforts to ensure individualized and equal justice," he said, adding, "they may exacerbate unwarranted and unjust disparities that are already far too common in our criminal justice system and in our society."

The sentencing commission did not, however, launch a study of risk scores. So ProPublica did, as part of a larger examination of the powerful, largely hidden effect of algorithms in American life.

We obtained the risk scores assigned to more than 7,000 people arrested in Broward County, Florida, in 2013 and 2014 and checked to see how many were charged with new crimes over the next two years, the same benchmark used by the creators of the algorithm.

The score proved remarkably unreliable in forecasting violent crime: Only 20 percent of the people predicted to commit violent crimes actually went on to do so.

When a full range of crimes were taken into account — including misdemeanors such as driving with an expired license — the algorithm was somewhat more accurate than a coin flip. Of those deemed likely to re-offend, 61 percent were arrested for any subsequent crimes within two years.

We also turned up significant racial disparities, just as Holder feared. In forecasting who would re-offend, the algorithm made mistakes with black and white defendants at roughly the same rate but in very different ways.

- The formula was particularly likely to falsely flag black defendants as future criminals, wrongly labeling them this way at almost twice the rate as white defendants.
- White defendants were mislabeled as low risk more often than black defendants.

Could this disparity be explained by defendants' prior crimes or the type of crimes they were arrested for? No. We ran a statistical test that isolated the effect of race from criminal history and recidivism, as well as from defendants' age and gender. Black defendants were still 77 percent more likely to be pegged as at higher risk of committing a future violent crime and 45 percent more likely to be predicted to commit a future crime of any kind. (Read our analysis.)

The algorithm used to create the Florida risk scores is a product of a for-profit company, Northpointe. The company disputes our analysis.

In a letter, it criticized ProPublica's methodology and defended the accuracy of its test: "Northpointe does not agree that the results of your analysis, or the claims being made based upon that analysis, are correct or that they accurately reflect the outcomes from the application of the model."

Northpointe's software is among the most widely used assessment tools in the country. The company does not publicly disclose the calculations used to arrive at defendants' risk scores, so it is not possible for either defendants or the public to see what might be driving the disparity. (On Sunday, Northpointe gave ProPublica the basics of its future-crime formula — which includes factors such as education levels, and whether a defendant has a job. It did not share the specific calculations, which it said are proprietary.)

Northpointe's core product is a set of scores derived from 137 questions that are either answered by defendants or pulled from criminal records. Race is not one of the questions. The survey asks defendants such things as: "Was one of your parents ever sent to jail or prison?" "How many of your friends/acquaintances are taking drugs illegally?" and "How often did you get in fights while at school?" The questionnaire also asks people to agree or disagree with statements such as "A hungry person has a right to steal" and "If people make me angry or lose my temper, I can be dangerous."

The appeal of risk scores is obvious: The United States locks up far more people than any other country, a disproportionate number of them black. For more than two centuries, the key decisions in the legal process, from pretrial release to sentencing to parole, have been in the hands of human beings guided by their instincts and personal biases.

If computers could accurately predict which defendants were likely to commit new crimes, the criminal justice system could be fairer and more selective about who is incarcerated and for how long. The trick, of course, is to make sure the computer gets it right. If it's wrong in one direction, a dangerous criminal could go free. If it's wrong in another direction, it could result in someone unfairly receiving a harsher sentence or waiting longer for parole than is appropriate.

The first time Paul Zilly heard of his score — and realized how much was riding on it — was during his sentencing hearing on Feb. 15, 2013, in court in Barron County, Wisconsin. Zilly had been convicted of stealing a push lawnmower and some tools. The prosecutor recommended a year in county jail and follow-up supervision that could help Zilly with "staying on the right path." His lawyer agreed to a plea deal.

But Judge James Babler had seen Zilly's scores. Northpointe's software had rated Zilly as a high risk for future violent crime and a medium risk for general recidivism. "When I look at the risk assessment," Babler said in court, "it is about as bad as it could be."

Then Babler overturned the plea deal that had been agreed on by the prosecution and defense and imposed two years in state prison and three years of supervision.

CRIMINOLOGISTS HAVE LONG TRIED to predict which criminals are more dangerous before deciding whether they should be released. Race, nationality and skin color were often used in making such predictions until about the 1970s, when it became politically unacceptable, according to a survey of risk assessment tools by Columbia University law professor Bernard Harcourt.

In the 1980s, as a crime wave engulfed the nation, lawmakers made it much harder for judges and parole boards to exercise discretion in making such decisions. States and the federal government began instituting mandatory sentences and, in some cases, abolished parole, making it less important to evaluate individual offenders.

But as states struggle to pay for swelling prison and jail populations, forecasting criminal risk has made a comeback.

Dozens of risk assessments are being used across the nation — some created by for-profit companies such as Northpointe and others by nonprofit organizations. (One tool being used in states including Kentucky and Arizona, called the Public Safety Assessment, was developed by the Laura and John Arnold Foundation, which also is a funder of ProPublica.)

Two Drug Possession Arrests

Fugett was rated low risk after being arrested with cocaine and marijuana. He was arrested three times on drug charges after that.

There have been few independent studies of these criminal risk assessments. In 2013, researchers Sarah Desmarais and Jay Singh examined 19 different risk methodologies used in the United States and found that "in most cases, validity had only been examined in one or two studies" and that "frequently, those investigations were completed by the same people who developed the instrument."

Their analysis of the research through 2012 found that the tools "were moderate at best in terms of predictive validity," Desmarais said in an interview. And she could not find any substantial set of studies conducted in the United States that examined whether risk scores were racially biased. "The data do not exist," she said.

Since then, there have been some attempts to explore racial disparities in risk scores. One 2016 study examined the validity of a risk assessment tool, not Northpointe's, used to make probation decisions for about 35,000 federal convicts. The researchers, Jennifer Skeem at University of California, Berkeley, and Christopher T. Lowenkamp from the Administrative Office of the U.S. Courts, found that blacks did get a higher average score but concluded the differences were not attributable to bias.

The increasing use of risk scores is controversial and has garnered media coverage, including articles by the Associated Press, and the Marshall Project and FiveThirtyEight last year.

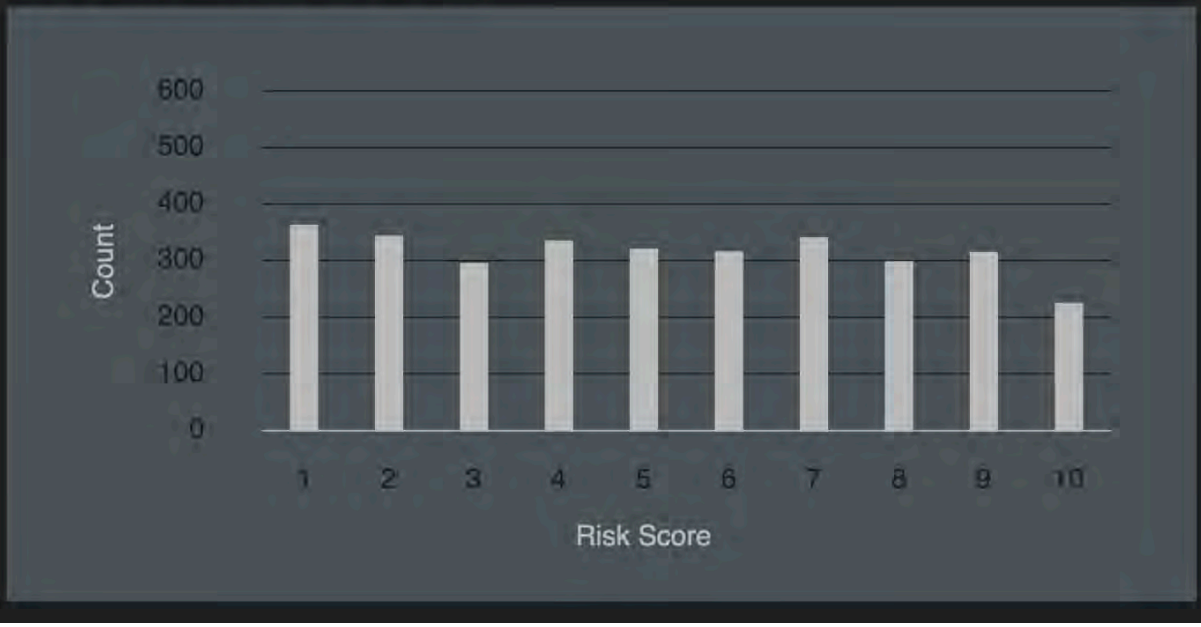
Most modern risk tools were originally designed to provide judges with insight into the types of treatment that an individual might need — from drug treatment to mental health counseling.

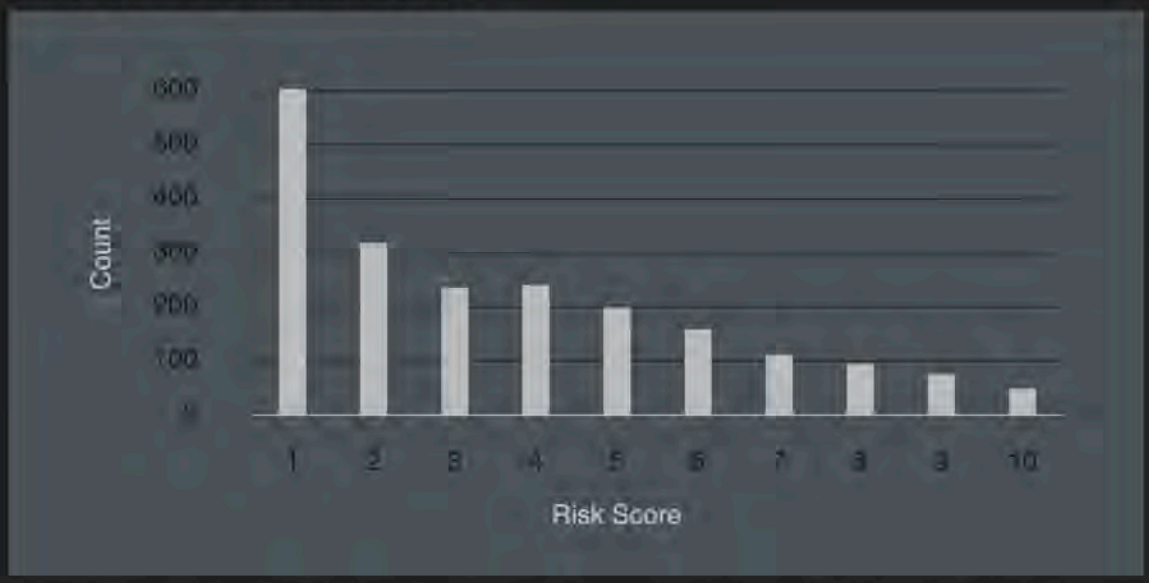
"What it tells the judge is that if I put you on probation, I'm going to need to give you a lot of services or you're probably going to fail," said Edward Latessa, a University of Cincinnati professor who is the author of a risk assessment tool that is used in Ohio and several other states.

But being judged ineligible for alternative treatment — particularly during a sentencing hearing — can translate into incarceration. Defendants rarely have an opportunity to challenge their assessments. The results are usually shared with the defendant's attorney, but the calculations that transformed the underlying data into a score are rarely revealed.

"Risk assessments should be impermissible unless both parties get to see all the data that go into them," said Christopher Slobogin, director of the criminal justice program at Vanderbilt Law School. "It should be an open, full-court adversarial proceeding."

Black Defendants' Risk Scores





These charts show that scores for white defendants were skewed toward lower-risk categories. Scores for black defendants were not. (*Source: ProPublica analysis of data from Broward County, Fla.*)

Proponents of risk scores argue they can be used to reduce the rate of incarceration. In 2002, Virginia became one of the first states to begin using a risk assessment tool in the sentencing of nonviolent felony offenders statewide. In 2014, Virginia judges using the tool sent nearly half of those defendants to alternatives to prison, according to a state sentencing commission report. Since 2005, the state's prison population growth has slowed to 5 percent from a rate of 31 percent the previous decade.

In some jurisdictions, such as Napa County, California, the probation department uses risk assessments to suggest to the judge an appropriate probation or treatment plan for individuals being sentenced. Napa County Superior Court Judge Mark Boessenecker said he finds the recommendations helpful. "We have a dearth of good treatment programs, so filling a slot in a program with someone who doesn't need it is foolish," he said.

However, Boessenecker, who trains other judges around the state in evidence-based sentencing, cautions his colleagues that the score doesn't necessarily reveal whether a person is dangerous or if they should go to prison.

"A guy who has molested a small child every day for a year could still come out as a low risk because he probably has a job," Boessenecker said. "Meanwhile, a drunk guy will look high risk because he's homeless. These risk factors don't tell you whether the guy ought to go to prison or not; the risk factors tell you more about what the probation conditions ought to be."

Sometimes, the scores make little sense even to defendants.

James Rivelli, a 54-year old Hollywood, Florida, man, was arrested two years ago for shoplifting seven boxes of Crest Whitestrips from a CVS drugstore. Despite a criminal record that included aggravated assault, multiple thefts and felony drug trafficking, the Northpointe algorithm classified him as being at a low risk of reoffending.

"I am surprised it is so low," Rivelli said when told by a reporter he had been rated a 3 out of a possible 10. "I spent five years in state prison in Massachusetts. But I guess they don't count that here in Broward County." In fact, criminal records from across the nation are supposed to be included in risk assessments.

"I'm surprised [my risk score] is so low. I spent five years in state prison in Massachusetts." (Josh Ritchie for ProPublica)

Less than a year later, he was charged with two felony counts for shoplifting about $1,000 worth of tools from Home Depot. He said his crimes were fueled by drug addiction and that he is now sober.

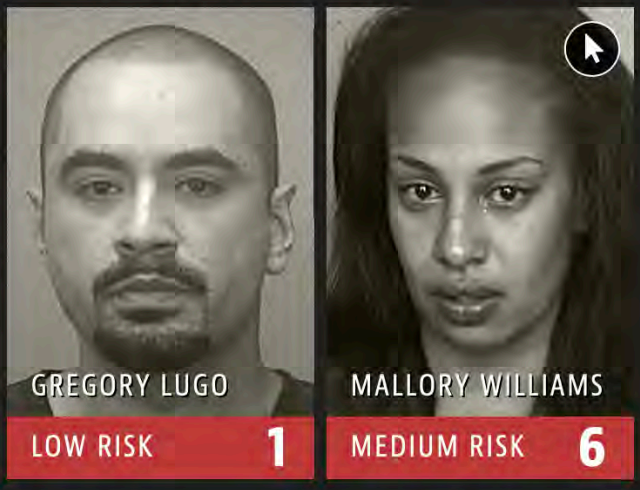
NORTHPOINTE WAS FOUNDED in 1989 by Tim Brennan, then a professor of statistics at the University of Colorado, and Dave Wells, who was running a corrections program in Traverse City, Michigan.

Wells had built a prisoner classification system for his jail. "It was a beautiful piece of work," Brennan said in an interview conducted before ProPublica had completed its analysis. Brennan and Wells shared a love for what Brennan called "quantitative taxonomy" — the measurement of personality traits such as intelligence, extroversion and introversion. The two decided to build a risk assessment score for the corrections industry.

Brennan wanted to improve on a leading risk assessment score, the LSI, or Level of Service Inventory, which had been developed in Canada. "I found a fair amount of weakness in the LSI," Brennan said. He wanted a tool that addressed the major theories about the causes of crime.

Brennan and Wells named their product the Correctional Offender Management Profiling for Alternative Sanctions, or COMPAS. It assesses not just risk but also nearly two dozen so-called "criminogenic needs" that relate to the major theories of criminality, including "criminal personality," "social isolation," "substance abuse" and "residence/stability." Defendants are ranked low, medium or high risk in each category.

Two DUI Arrests



Lugo crashed his Lincoln Navigator into a Toyota Camry while drunk. He was rated as a low risk of reoffending despite the fact that it was at least his fourth DUI.

As often happens with risk assessment tools, many jurisdictions have adopted Northpointe's software before rigorously testing whether it works. New York State, for instance, started using the tool to assess people on probation in a pilot project in 2001 and rolled it out to the rest of the state's probation departments — except New York City — by 2010. The state didn't publish a comprehensive statistical evaluation of the tool until 2012. The study of more than 16,000 probationers found the tool was 71 percent accurate, but it did not evaluate racial differences.

A spokeswoman for the New York state division of criminal justice services said the study did not examine race because it only sought to test whether the tool had been properly calibrated to fit New York's probation population. She also said judges in nearly all New York counties are given defendants' Northpointe assessments during sentencing.

In 2009, Brennan and two colleagues published a validation study that found that Northpointe's risk of recidivism score had an accuracy rate of 68 percent in a sample of 2,328 people. Their study also found that the score was slightly less predictive for black men than white men — 67 percent versus 69 percent. It did not examine racial disparities beyond that, including whether some groups were more likely to be wrongly labeled higher risk.

Brennan said it is difficult to construct a score that doesn't include items that can be correlated with race — such as poverty, joblessness and social marginalization. "If those are omitted from your risk assessment, accuracy goes down," he said.

In 2011, Brennan and Wells sold Northpointe to Toronto-based conglomerate Constellation Software for an undisclosed sum.

Wisconsin has been among the most eager and expansive users of Northpointe's risk assessment tool in sentencing decisions. In 2012, the Wisconsin Department of Corrections launched the use of the software throughout the state. It is used at each step in the prison system, from sentencing to parole.

In a 2012 presentation, corrections official Jared Hoy described the system as a "giant correctional pinball machine" in which correctional officers could use the scores at every "decision point."

Wisconsin has not yet completed a statistical validation study of the tool and has not said when one might be released. State corrections officials declined repeated requests to comment for this article.

Some Wisconsin counties use other risk assessment tools at arrest to determine if a defendant is too risky for pretrial release. Once a defendant is convicted of a felony anywhere in the state, the Department of Corrections attaches Northpointe's assessment to the confidential presentence report given to judges, according to Hoy's presentation.

In theory, judges are not supposed to give longer sentences to defendants with higher risk scores. Rather, they are supposed to use the tests primarily to determine which defendants are eligible for probation or treatment programs.

Prediction Fails Differently for Black Defendants

	WHITE	AFRICAN AMERICAN
Labeled Higher Risk, But Didn't Re-Offend	23.5%	44.9%
Labeled Lower Risk, Yet Did Re-Offend	47.7%	28.0%

Overall, Northpointe's assessment tool correctly predicts recidivism 61 percent of the time. But blacks are almost twice as likely as whites to be labeled a higher risk but not actually re-offend. It makes the opposite mistake among whites: They are much more likely than blacks to be labeled lower risk but go on to commit other crimes. (Source: ProPublica analysis of data from Broward County, Fla.)

But judges have cited scores in their sentencing decisions. In August 2013, Judge Scott Horne in La Crosse County, Wisconsin, declared that defendant Eric Loomis had been "identified, through the COMPAS assessment, as an individual who is at high risk to the community." The judge then imposed a sentence of eight years and six months in prison.

Loomis, who was charged with driving a stolen vehicle and fleeing from police, is challenging the use of the score at sentencing as a violation of his due process rights. The state has defended Horne's use of the score with the argument that judges can consider the score in addition to other factors. It has also stopped including scores in presentencing reports until the state Supreme Court decides the case.

"The risk score alone should not determine the sentence of an offender," Wisconsin Assistant Attorney General Christine Remington said last month during state Supreme Court arguments in the Loomis case. "We don't want courts to say, this person in front of me is a 10 on COMPAS as far as risk, and therefore I'm going to give him the maximum sentence."

That is almost exactly what happened to Zilly, the 48-year-old construction worker sent to prison for stealing a push lawnmower and some tools he intended to sell for parts. Zilly has long struggled with a meth habit. In 2012, he had been working toward recovery with the help of a Christian pastor when he relapsed and committed the thefts.

After Zilly was scored as a high risk for violent recidivism and sent to prison, a public defender appealed the sentence and called the score's creator, Brennan, as a witness.

Brennan testified that he didn't design his software to be used in sentencing. "I wanted to stay away from the courts," Brennan said, explaining that his focus was on reducing crime rather than punishment. "But as time went on I started realizing that so many decisions are made, you know, in the courts. So I gradually softened on whether this could be used in the courts or not."

"Not that I'm innocent, but I just believe people do change." *(Stephen Maturen for ProPublica)*

Still, Brennan testified, "I don't like the idea myself of COMPAS being the sole evidence that a decision would be based upon."

After Brennan's testimony, Judge Babler reduced Zilly's sentence, from two years in prison to 18 months. "Had I not had the COMPAS, I believe it would likely be that I would have given one year, six months," the judge said at an appeals hearing on Nov. 14, 2013.

Zilly said the score didn't take into account all the changes he was making in his life — his conversion to Christianity, his struggle to quit using drugs and his efforts to be more available for his son. "Not that I'm innocent, but I just believe people do change."

FLORIDA'S BROWARD COUNTY, where Brisha Borden stole the Huffy bike and was scored as high risk, does not use risk assessments in sentencing. "We don't think the [risk assessment] factors have any bearing on a sentence," said David Scharf, executive director of community programs for the Broward County Sheriff's Office in Fort Lauderdale.

Broward County has, however, adopted the score in pretrial hearings, in the hope of addressing jail overcrowding. A court-appointed monitor has overseen Broward County's jails since 1994 as a result of the settlement of a lawsuit brought by inmates in the 1970s. Even now, years later, the Broward County jail system is often more than 85 percent full, Scharf said.

In 2008, the sheriff's office decided that instead of building another jail, it would begin using Northpointe's risk scores to help identify which defendants were low risk enough to be released on bail pending trial. Since then, nearly everyone arrested in Broward has been scored soon after being booked. (People charged with murder and other capital crimes are not scored because they are not eligible for pretrial release.)

The scores are provided to the judges who decide which defendants can be released from jail. "My feeling is that if they don't need them to be in jail, let's get them out of there," Scharf said.

Scharf said the county chose Northpointe's software over other tools because it was easy to use and produced "simple yet effective charts and graphs for judicial review." He said the system costs about $22,000 a year.

In 2010, researchers at Florida State University examined the use of Northpointe's system in Broward County over a 12-month period and concluded that its predictive accuracy was "equivalent" in assessing defendants of different races. Like others, they did not examine whether different races were classified differently as low or high risk.

Scharf said the county would review ProPublica's findings. "We'll really look at them up close," he said.

Two Shoplifting Arrests

After Rivelli stole from a CVS and was caught with heroin in his car, he was rated a low risk. He later shoplifted $1,000 worth of tools from a Home Depot.

Broward County Judge John Hurley, who oversees most of the pretrial release hearings, said the scores were helpful when he was a new judge, but now that he has experience he prefers to rely on his own judgment. "I haven't relied on COMPAS in a couple years," he said.

Hurley said he relies on factors including a person's prior criminal record, the type of crime committed, ties to the community, and their history of failing to appear at court proceedings.

ProPublica's analysis reveals that higher Northpointe scores are slightly correlated with longer pretrial incarceration in Broward County. But there are many reasons that could be true other than judges being swayed by the scores — people with higher risk scores may also be poorer and have difficulty paying bond, for example.

Most crimes are presented to the judge with a recommended bond amount, but he or she can adjust the amount. Hurley said he often releases first-time or low-level offenders without any bond at all.

However, in the case of Borden and her friend Sade Jones, the teenage girls who stole a kid's bike and scooter, Hurley raised the bond amount for each girl from the recommended $0 to $1,000 each.

Hurley said he has no recollection of the case and cannot recall if the scores influenced his decision.

Sade Jones, who had never been arrested before, was rated a medium risk. *(Josh Ritchie for ProPublica)*

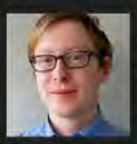
The girls spent two nights in jail before being released on bond.

"We literally sat there and cried" the whole time they were in jail, Jones recalled. The girls were kept in the same cell. Otherwise, Jones said, "I would have gone crazy." Borden declined repeated requests to comment for this article.

Jones, who had never been arrested before, was rated a medium risk. She completed probation and got the felony burglary charge reduced to misdemeanor trespassing, but she has still struggled to find work.

"I went to McDonald's and a dollar store, and they all said no because of my background," she said. "It's all kind of difficult and unnecessary."

Julia Angwin is a senior reporter at ProPublica. From 2000 to 2013, she was a reporter at The Wall Street Journal, where she led a privacy investigative team that was a finalist for a Pulitzer Prize in Explanatory Reporting in 2011 and won a Gerald Loeb Award in 2010.



Jeff Larson is the Data Editor at ProPublica. He is a winner of the Livingston Award for the 2011 series Redistricting: How Powerful Interests are Drawing You Out of a Vote. Jeff's public key can be found here.

A group of industry, academic, and government experts convene in Philadelphia to explore the roots of algorithmic bias.

BY ALEXANDRA CHOULDECHOVA AND AARON ROTH

A Snapshot of the Frontiers of Fairness in Machine Learning

THE LAST DECADE has seen a vast increase both in the diversity of applications to which machine learning is applied, and to the import of those applications. Machine learning is no longer just the engine behind ad placements and spam filters; it is now used to filter loan applicants, deploy police officers, and inform bail and parole decisions, among other things. The result has been a major concern for the potential for data-driven methods to introduce and perpetuate discriminatory practices, and to otherwise be unfair. And this concern has not been without reason: a steady stream of empirical findings has shown that data-driven methods can unintentionally both encode existing human biases and introduce new ones.[7,9,11,60]

At the same time, the last two years have seen an unprecedented explosion in interest from the academic community in studying fairness and machine learning. "Fairness and transparency" transformed from a niche topic with a trickle of papers produced every year (at least since the work of Pedresh[56] to a major subfield of machine learning, complete with a dedicated archival conference—ACM FAT*). But despite the volume and velocity of published work, our understanding of the fundamental questions related to fairness and machine learning remain in its infancy. What should fairness mean? What are the causes that introduce unfairness in machine learning? How best should we modify our algorithms to avoid unfairness? And what are the corresponding trade offs with which we must grapple?

In March 2018, we convened a group of about 50 experts in Philadelphia, drawn from academia, industry, and government, to assess the state of our understanding of the fundamentals of the nascent science of fairness in machine learning, and to identify the unanswered questions that seem the most pressing. By necessity, the aim of the workshop was not to comprehensively cover the vast growing field, much of which is empirical. Instead, the focus was on theoretical work aimed at providing a scientific foundation for understanding algo-

» key insights

- **The algorithmic fairness literature is enormous and growing quickly, but our understanding of basic questions remains nascent.**
- **Researchers have yet to find entirely compelling definitions, and current work focuses mostly on supervised learning in static settings.**
- **There are many compelling open questions related to robustly accounting for the effects of interventions in dynamic settings, learning in the presence of data contaminated with human bias, and finding definitions of fairness that guarantee individual-level semantics while remaining actionable.**

ILLUSTRATION BY JUSTIN METZ

rithmic bias. This document captures several of the key ideas and directions discussed. It is not an exhaustive account of work in the area.

What We Know

Even before we precisely specify what we mean by "fairness," we can identify common distortions that can lead off-the-shelf machine learning techniques to produce behavior that is intuitively unfair. These include:

1. *Bias encoded in data.* Often, the training data we have on hand already includes human biases. For example, in the problem of recidivism prediction used to inform bail and parole decisions, the goal is to predict whether an inmate, if released, will go on to commit another crime within a fixed period of time. But we do not have data on who commits crimes—we have data on who is arrested. There is reason to believe that arrest data—especially for drug crimes—is skewed toward minority populations that are policed at a higher rate.[59] Of course, machine learning techniques are designed to fit the data, and so will naturally replicate any bias already present in the data. There is no reason to expect them to remove existing bias.

2. *Minimizing average error fits majority populations.* Different populations of people have different distributions over features, and those features have different relationships to the label that we are trying to predict. As an example, consider the task of predicting college performance based on high school data. Suppose there is a majority population and a minority population. The majority population employs SAT tutors and takes the exam multiple times, reporting only the highest score. The minority population does not. We should naturally expect both that SAT scores are higher among the majority population, and that their relationship to college performance is differently calibrated compared to the minority population. But if we train a group-blind classifier to minimize overall error, if it cannot simultaneously fit both populations optimally, it will fit the majority population. This is because—simply by virtue of their numbers—the fit to the majority population is more important to overall error than the fit to the minority population. This leads to a different (and higher) distribution of errors in the minority population. This effect can be quantified and can be partially alleviated via concerted data gathering effort.[14]

Given the limitations of extant notions of fairness, is there a way to get some of the "best of both worlds?"

3. *The need to explore.* In many important problems, including recidivism prediction and drug trials, the data fed into the prediction algorithm depends on the actions that algorithm has taken in the past. We only observe whether an inmate will recidivate if we release him. We only observe the efficacy of a drug on patients to whom it is assigned. Learning theory tells us that in order to effectively learn in such scenarios, we need to explore—that is, sometimes take actions we believe to be sub-optimal in order to gather more data. This leads to at least two distinct ethical questions. First, when are the individual costs of exploration borne disproportionately by a certain sub-population? Second, if in certain (for example, medical) scenarios, we view it as immoral to take actions we believe to be sub-optimal for any particular patient, how much does this slow learning, and does this lead to other sorts of unfairness?

Definitions of fairness. With a few exceptions, the vast majority of work to date on fairness in machine learning has focused on the task of batch classification. At a high level, this literature has focused on two main families of definitions:[a] statistical notions of fairness and individual notions of fairness. We briefly review what is known about these approaches to fairness, their advantages, and their shortcomings.

Statistical definitions of fairness. Most of the literature on fair classification focuses on statistical definitions of fairness. This family of definitions fixes a small number of protected demographic groups G (such as racial groups), and then ask for (approximate) parity of some statistical measure across all of these groups. Popular measures include raw positive classification rate, considered in

a There is also an emerging line of work that considers causal notions of fairness (for example, see Kilbertus,[43] Kusner,[48] Nabi[55]). We intentionally avoided discussions of this potentially important direction because it will be the subject of its own CCC visioning workshop.

work such as Calders,[10] Dwork,[19] Feldman,[25] Kamishima,[36] (also sometimes known as statistical parity,[19] false positive and false negative rates[15,29,46,63] (also sometimes known as equalized odds[29]), and positive predictive value[15,46] (closely related to equalized calibration when working with real valued risk scores). There are others—see, for example, Berk[4] for a more exhaustive enumeration.

This family of fairness definitions is attractive because it is simple, and definitions from this family can be achieved without making any assumptions on the data and can be easily verified. However, statistical definitions of fairness do not on their own give meaningful guarantees to individuals or structured subgroups of the protected demographic groups. Instead they give guarantees to "average" members of the protected groups. (See Dwork[19] for a litany of ways in which statistical parity and similar notions can fail to provide meaningful guarantees, and Kearns[40] for examples of how some of these weaknesses carry over to definitions that equalize false positive and negative rates.) Different statistical measures of fairness can be at odds with one another. For example, Chouldechova[15] and Kleinberg[46] prove a fundamental impossibility result: except in trivial settings, it is impossible to simultaneously equalize false positive rates, false negative rates, and positive predictive value across protected groups. Learning subject to statistical fairness constraints can also be computationally hard,[61] although practical algorithms of various sorts are known.[1,29,63]

Individual definitions of fairness. Individual notions of fairness, on the other hand, ask for constraints that bind on specific pairs of individuals, rather than on a quantity that is averaged over groups. For example, Dwork[19] gives a definition which roughly corresponds to the constraint that "similar individuals should be treated similarly," where similarity is defined with respect to a task-specific metric that must be determined on a case by case basis. Joseph[35] suggests a definition that corresponds approximately to "less qualified individuals should not be favored over more qualified individuals," where quality is defined with respect to the true underlying label (unknown to the algorithm). However, although the semantics of these kinds of definitions can be more meaningful than statistical approaches to fairness, the major stumbling block is that they seem to require making significant assumptions. For example, the approach of Dwork[19] presupposes the existence of an agreed upon similarity metric, whose definition would itself seemingly require solving a non-trivial problem in fairness, and the approach of Joseph[35] seems to require strong assumptions on the functional form of the relationship between features and labels in order to be usefully put into practice. These obstacles are serious enough that it remains unclear whether individual notions of fairness can be made practical—although attempting to bridge this gap is an important and ongoing research agenda.

Questions at the Research Frontier

Given the limitations of extant notions of fairness, is there a way to get some of the "best of both worlds?" In other words, constraints that are practically implementable without the need for making strong assumptions on the data or the knowledge of the algorithm designer, but which nevertheless provide more meaningful guarantees to individuals? Two recent papers, Kearns[40] and Hèbert-Johnson[30] (see also Kearns[42] and Kim[44] for empirical evaluations of the algorithms proposed in these papers), attempt to do this by asking for statistical fairness definitions to hold not just on a small number of protected groups, but on an exponential or infinite class of groups defined by some class of functions of bounded complexity. This approach seems promising—because, ultimately, they are asking for statistical notions of fairness—the approaches proposed by these papers enjoy the benefits of statistical fairness: that no assumptions need be made about the data, nor is any external knowledge (like a fairness metric) needed. It also better addresses concerns about "intersectionality," a term used to describe how different kinds of discrimination can compound and interact for individuals who fall at the intersection of several protected classes.

At the same time, the approach raises a number of additional questions: What function classes are reasonable, and once one is decided upon (for example, conjunctions of protected attributes), what features should be "protected?" Should these only be attributes that are sensitive on their own, like race and gender, or might attributes that are innocuous on their own correspond to groups we wish to protect once we consider their intersection with protected attributes (for example clothing styles intersected with race or gender)? Finally, this family of approaches significantly mitigates some of the weaknesses of statistical notions of fairness by asking for the constraints to hold on average not just over a small number of coarsely defined groups, but over very finely defined groups as well. Ultimately, however, it inherits the weaknesses of statistical fairness as well, just on a more limited scale.

Another recent line of work aims to weaken the strongest assumption needed for the notion of individual fairness from Dwork:[19] namely the algorithm designer has perfect knowledge of a "fairness metric." Kim[45] assumes the algorithm has access to an oracle which can return an unbiased estimator for the distance between two randomly drawn individuals according to an unknown fairness metric, and show how to use this to ensure a statistical notion of fairness related to Hèbert-Johnson[30] and Kearns,[40] which informally state that "on average, individuals in two groups should be treated similarly if on average the individuals in the two groups are similar" and this can be achieved with respect to an exponentially or infinitely large set of groups. Similarly, Gillen[28] assumes the existence of an oracle, which can identify fairness violations when they are made in an online setting but cannot quantify the extent of the violation (with respect to the unknown metric). It is shown that when the metric is from a specific learnable family, this kind of feedback is sufficient to obtain an optimal regret bound to the best fair classifier while having only a bounded number of violations of the fairness metric. Rothblum[58] considers the case in which

the metric is known and show that a PAC-inspired approximate variant of metric fairness generalizes to new data drawn from the same underlying distribution. Ultimately, however, these approaches all assume fairness is perfectly defined with respect to some metric, and that there is some sort of direct access to it. Can these approaches be generalized to a more "agnostic" setting, in which fairness feedback is given by human beings who may not be responding in a way that is consistent with any metric?

Data evolution and dynamics of fairness. The vast majority of work in computer science on algorithmic fairness has focused on one-shot classification tasks. But real algorithmic systems consist of many different components combined together, and operate in complex environments that are dynamically changing, sometimes because of the actions of the learning algorithm itself. For the field to progress, we need to understand the dynamics of fairness in more complex systems.

Perhaps the simplest aspect of dynamics that remains poorly understood is how and when components that may individually satisfy notions of fairness compose into larger constructs that still satisfy fairness guarantees. For example, if the bidders in an advertising auction individually are fair with respect to their bidding decisions, when will the allocation of advertisements be fair, and when will it not? Bower[8] and Dwork[20] have made a preliminary foray in this direction. These papers embark on a systematic study of fairness under composition and find that often the composition of multiple fair components will not satisfy any fairness constraint at all. Similarly, the individual components of a fair system may appear to be unfair in isolation. There are certain special settings, for example, the "filtering pipeline" scenario of Bower[8]—modeling a scenario in which a job applicant is selected only if she is selected at every stage of the pipeline—in which (multiplicative approximations of) statistical fairness notions compose in a well behaved way. But the high-level message from these works is that our current notions of fairness compose poorly. Experience from differential privacy[21,22] suggests that graceful degradation under composition is key to designing complicated algorithms satisfying desirabl e statistical properties, because it allows algorithm design and analysis to be modular. Thus, it seems important to find satisfying fairness definitions and richer frameworks that behave well under composition.

In dealing with socio-technical systems, it is also important to understand how algorithms dynamically effect their environment, and the incentives of human actors. For example, if the bar (for example, college admission) is lowered for a group of individuals, this might increase the average qualifications for this group over time because of at least two effects: a larger proportion of children in the next generation grow up in households with college educated parents (and the opportunities this provides), and the fact that a college education is achievable can incentivize effort to prepare academically. These kinds of effects are not considered when considering either statistical or individual notions of fairness in one-shot learning settings.

The economics literature on affirmative action has long considered such effects—although not with the specifics of machine learning in mind: see, for example, Becker,[3] Coat,[16] Foster.[26] More recently, there have been some preliminary attempts to model these kinds of effects in machine learning settings—for example, by modeling the environment as a Markov decision process,[32] considering the equilibrium effects of imposing statistical definitions of fairness in a model of a labor market,[31] specifying the functional relationship between classification outcomes and quality,[49] or by considering the effect of a classifier on a downstream Bayesian decision maker.[39] However, the specific predictions of most of the models of this sort are brittle to the specific modeling assumptions made—they point to the need to consider long term dynamics, but do not provide robust guidance for how to navigate them. More work is needed here.

Finally, decision making is often distributed between a large number of actors who share different goals and do not necessarily coordinate. In settings like this, in which we do not have direct control over the decision-making process, it is important to think about how to incentivize rational agents to behave in a way that we view as fair. Kannan[37] takes a preliminary stab at this task, showing how to incentivize a particular notion of individual fairness in a simple, stylized setting, using small monetary payments. But how should this work for other notions of fairness, and in more complex settings? Can this be done by controlling the flow of information, rather than by making monetary payments (monetary payments might be distasteful in various fairness-relevant settings)? More work is needed here as well. Finally, Corbett-Davies[17] take a welfare maximization view of fairness in classification and characterize the cost of imposing additional statistical fairness constraints as well. But this is done in a static environment. How would the conclusions change under a dynamic model?

Modeling and correcting bias in the data. Fairness concerns typically surface precisely in settings where the available training data is already contaminated by bias. The data itself is often a product of social and historical process that operated to the disadvantage of certain groups. When trained in such data, off-the-shelf machine learning techniques may reproduce, reinforce, and potentially exacerbate existing biases. Understanding how bias arises in the data, and how to correct for it, are fundamental challenges in the study of fairness in machine learning.

Bolukbasi[7] demonstrate how machine learning can reproduce biases in their analysis of the popular word-2vec embedding trained on a corpus of Google News texts (parallel effects were independently discovered by Caliskan[11]). The authors show that the trained embedding exhibit female/male gender stereotypes, learning that "doctor" is more similar to man than to woman, along with analogies such as "man is to computer programmer as woman is to homemaker." Even if such learned associations accurately reflect patterns in the source text corpus, their use in automated systems may exacerbate existing bi-

ases. For instance, it might result in male applicants being ranked more highly than equally qualified female applicants in queries related to jobs that the embedding identifies as male-associated.

Similar risks arise whenever there is potential for feedback loops. These are situations where the trained machine learning model informs decisions that then affect the data collected for future iterations of the training process. Lum[51] demonstrate how feedback loops might arise in predictive policing if arrest data were used to train the model.[b] In a nutshell, since police are likely to make more arrests in more heavily policed areas, using arrest data to predict crime hotspots will disproportionately concentrate policing efforts on already over-policed communities. Expanding on this analysis, Ensign[24] finds that incorporating community-driven data, such as crime reporting, helps to attenuate the biasing feedback effects. The authors also propose a strategy for accounting for feedback by adjusting arrest counts for policing intensity. The success of the mitigation strategy, of course, depends on how well the simple theoretical model reflects the true relationships between crime intensity, policing, and arrests. Problematically, such relationships are often unknown, and are very difficult to infer from data. This situation is by no means specific to predictive policing.

Correcting for data bias generally seems to require knowledge of how the measurement process is biased, or judgments about properties the data would satisfy in an "unbiased" world. Friedler[27] formalize this as a disconnect between the *observed space*—features that are observed in the data, such as SAT scores—and the unobservable *construct space*—features that form the desired basis for decision making, such as intelligence. Within this framework, data correction efforts attempt to undo the effects of biasing mechanisms that drive discrepancies between these spaces. To the extent that the biasing mechanism cannot be inferred empirically, any correction effort must make explicit its underlying assumptions about this mechanism. What precisely is being assumed about the construct space? When can the mapping between the construct space and the observed space be learned and inverted? What form of fairness does the correction promote, and at what cost? The costs are often immediately realized, whereas the benefits are less tangible. We will directly observe reductions in prediction accuracy, but any gains hinge on a belief that the observed world is not one we should seek to replicate accurately in the first place. This is an area where tools from causality may offer a principled approach for drawing valid inference with respect to unobserved counterfactually 'fair' worlds.

Fair representations. Fair representation learning is a data debiasing process that produces transformations (intermediate representations) of the original data that retain as much of the task-relevant information as possible while removing information about sensitive or protected attributes. This is one approach to transforming biased observational data in which group membership may be inferred from other features, to a construct space where protected attributes are statistically independent of other features.

First introduced in the work of Zemel[64] fair representation learning produces a debiased data set that may in principle be used by other parties without any risk of disparate outcomes. Feldman[25] and McNamara[54] formalize this idea by showing how the disparate impact of a decision rule is bounded in terms of its balanced error rate as a predictor of the sensitive attribute.

Several recent papers have introduced new approaches for constructing fair representations. Feldman[25] propose rank-preserving procedures for repairing features to reduce or remove pairwise dependence with the protected attribute. Johndrow[33] build upon this work, introducing a likelihood-based approach that can additionally handle continuous protected attributes, discrete features, and which promotes joint independence

Fairness concerns typically surface precisely in settings where the available training data is already contaminated by bias.

b Predictive policing models are generally proprietary, and so it is not clear whether arrest data is used to train the model in any deployed system.

between the transformed features and the protected attributes. There is also a growing literature on using adversarial learning to achieve group fairness in the form of statistical parity or false positive/false negative rate balance.[5,23,52,65]

Existing theory shows the fairness-promoting benefits of fair-representation learning rely critically on the extent to which existing associations between the transformed features and the protected characteristics are removed. Adversarial downstream users may be able to recover protected attribute information if their models are more powerful than those used initially to obfuscate the data. This presents a challenge both to the generators of fair representations as well as to auditors and regulators tasked with certifying that the resulting data is fair for use. More work is needed to understand the implications of fair representation learning for promoting fairness in the real world.

Beyond classification. Although the majority of the work on fairness in machine learning focuses on batch classification, it is but one aspect of how machine learning is used. Much of machine learning—for example, online learning, bandit learning, and reinforcement learning—focuses on dynamic settings in which the actions of the algorithm feed back into the data it observes. These dynamic settings capture many problems for which fairness is a concern. For example, lending, criminal recidivism prediction, and sequential drug trials are so-called bandit learning problems, in which the algorithm cannot observe data corresponding to counterfactuals. We cannot see whether someone not granted a loan would have paid it back. We cannot see whether an inmate not released on parole would have gone on to commit another crime. We cannot see how a patient would have responded to a different drug.

The theory of learning in bandit settings is well understood, and it is characterized by a need to trade-off exploration with exploitation. Rather than always making a myopically optimal decision, when counterfactuals cannot be observed, it is necessary for algorithms to sometimes take actions that appear to be sub-optimal so as to gather more data. But in settings in which decisions correspond to individuals, this means sacrificing the well-being of a particular person for the potential benefit of future individuals. This can sometimes be unethical, and a source of unfairness.[6] Several recent papers explore this issue. For example, Bastani[2] and Kannan[38] give conditions under which linear learners need not explore at all in bandit settings, thereby allowing for best-effort service to each arriving individual, obviating the tension between ethical treatment of individuals and learning. Raghavan[57] show the costs associated with exploration can be unfairly bourn by a structured sub-population, and that counter-intuitively, those costs can actually increase when they are included with a majority population, even though more data increases the rate of learning overall. However, these results are all preliminary: they are restricted to settings in which the learner is learning a linear policy, and the data really is governed by a linear model. While illustrative, more work is needed to understand real-world learning in online settings, and the ethics of exploration.

Much of machine learning focuses on dynamic settings in which the actions of the algorithm feed back into the data it observes. These dynamic settings capture many problems for which fairness is a concern.

There is also some work on fairness in machine learning in other settings—for example, ranking,[12] selection,[42,47] personalization,[13] bandit learning,[34,50] human-classifier hybrid decision systems,[53] and reinforcement learning.[18,32] But outside of classification, the literature is relatively sparse. This should be rectified, because there are interesting and important fairness issues that arise in other settings—especially when there are combinatorial constraints on the set of individuals that can be selected for a task, or when there is a temporal aspect to learning.
